D	1/4 NPT	62165K8	52.61	62165K9	85.94

Solenoid Air Directional Control Valves with Flow Controls

In addition to sending air pressure to the right place at the right time, these valves can control the speed of that air pressure. All of these solenoid-operated valves can be operated remotely as well as in automated processes.

Valves are made of polyacetal and have an 8 mm female DIN connector and two M14 exhaust ports. Power draw is 2.7 watts for DC valves; 3.7 volt-amps for AC valves. Not vacuum rated.

Single-solenoid valves move into position when electrical current is supplied; a spring returns the valves to their original position once current is removed.

Double-solenoid valves move into position when electrical current is supplied to the first solenoid and return to their original position when current is supplied to the second solenoid.

To Order: Please specify 24V DC or 120V AC.

About Flow Control Valves

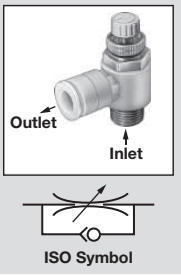
Also known as cylinder speed controls, flow control valves let you control the extension or retraction speed of your air cylinder. They regulate airflow in the flow-control direction (inlet to outlet) and allow air to flow freely in the other direction. Use the dial on the valve to adjust the airflow rate.

Connect flow control valves to the port of your cylinder. Choose a valve to control airflow as it exits the cylinder (meter out) or control airflow as it enters the cylinder (meter in). When in doubt, meter out.

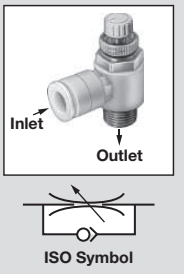
Flow Coefficient (Cv)—Is a measurement that indicates how much airflow a control valve can provide to your cylinder. The higher the flow coefficient value, the higher the airflow rate. Looking at valves with the same port size, but different flow coefficient values and not sure which one to choose? Select the one with the higher flow coefficient value because low airflow can slow down your entire system.

ISO Symbol—Found on most flow control valves, this symbol depicts the direction of airflow through the valve.

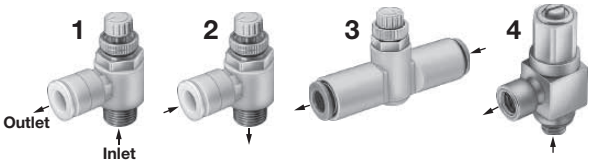
Valve Controls Airflow as it Exits Cylinder (Meter Out)



Valve Controls Airflow as it Enters Cylinder (Meter In)



Corrosion-Resistant Air Flow Control Valves



Made with stainless steel parts, these valves can handle corrosive environments. They regulate airflow in the flow-control direction (inlet to outlet) and let air flow freely in the other direction. Maximum pressure is 145 psi.

Plastic Valves—Have Type 303 stainless steel internal parts. Use the dial to adjust the airflow rate.

All-Stainless-Steel Valves—Made entirely of Type 316 stainless steel. Use the adjustment screw to adjust the airflow rate.

Precision-Adjust Air Flow Control Valves

A fine-adjustment dial allows tighter control of airflow and cylinder speed than other flow control valves. These valves regulate airflow in the flow-control direction (inlet to outlet) and let air flow freely in the other direction. Made of plastic. Maximum pressure is 145 psi.

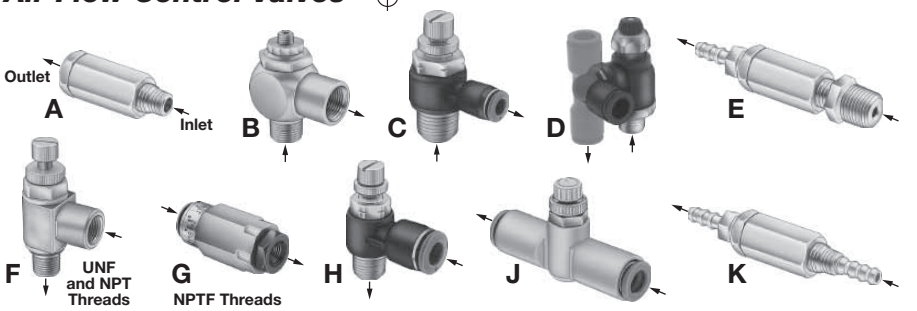
★ Max. scfm @ 87 psi.

Air Flow Control Valves



Control the extension or retraction speed of your air cylinder. Valves regulate airflow in the flow-control direction (inlet to outlet) and let air flow freely in the other direction. Use the dial to adjust the airflow rate. Maximum pressure is 145 psi, unless noted.

Styles A, B, E, and **K** are brass. **Styles C, H,** and **J** are plastic, unless noted. **Style D** are nylon and have a swivel tube fitting for mounting flexibility. **Style F** are zinc. **Style G** are nylon (NPT threads) or aluminum (NPTF threads).

High-Pressure Air Flow Control Valves

In addition to handling up to 265 psi of pressure, these brass valves have a universal thread on the inlet for connection to NPT, NPTF, BSPP, and BSPT threads. They regulate airflow in the flow-control direction (inlet to outlet) and let air flow freely in the other direction.

Tamper-Resistant Air Flow Control Valves

To prevent accidental airflow changes, an adjustment tool (sold below) is required to alter the airflow rate of these valves. All valves regulate airflow in the flow-control direction (inlet to outlet) and let air flow freely in the other direction. Made of plastic. Maximum pressure is 145 psi.

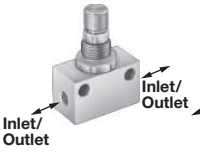
Bidirectional Air Flow Control Valves

Because they regulate airflow in both directions, these valves allow you to control the extension and retraction speed of your air cylinder. Made of aluminum, unless noted. Maximum pressure is 145 psi.



Single Control, Female Thread to Female Thread

Dual Control

Single-control valves have one knob to change the airflow equally in both directions. **Dual-control** valves have two knobs to independently change the airflow in each direction.

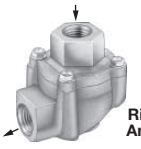
★Body has a hexagon shape. ■Made of nylon.

Quick-Exhaust Air Valves

Quickly dump exhaust air to speed up the movement of air cylinders.

Valves without Flow Control

Inline



Right Angle

Inline with Muffler

Valves exhaust directly to the atmosphere.

Inline—Made of brass and aluminum. Max. pressure is 125 psi.

Right Angle—Have an exhaust port that also allows you to route exhaust air to another place in your system. Made of aluminum. Maximum pressure is 125 psi.

Inline with Muffler—The muffler reduces exhaust noise. Valves are plastic. Maximum pressure is 145 psi.

Valves with Flow Control

Control your exhaust airflow rate. All valves have a muffler to reduce the exhaust noise. Maximum pressure is 145 psi.

Inline—Have one port that connects to the exhaust port of a directional control valve—good when you don't have easy access to your cylinder. Use a screwdriver to control the exhaust airflow to the atmosphere. Made of aluminum and brass.

Right Angle—A tube connection allows air to flow freely through the valve into your cylinder. Use the adjustment dial to control the exhaust airflow to the atmosphere. Valves are plastic.

Soft-Start Air Flow Control Valves

Protect your equipment from damage by limiting the startup airflow and then gradually raising the airflow rate to operating levels. Valves regulate airflow in the flow-control direction (inlet to outlet) and let air flow freely in the other direction. Use the dial to adjust the airflow rate. Made of aluminum. Maximum pressure is 101 psi.

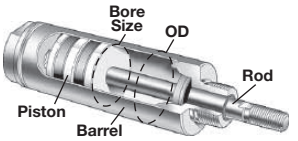
About Air Cylinders

Air cylinders operate on compressed air to create linear force. They're used to push, pull, open, close, lift, lower, position, and sort.

Measure the Cylinder OD to Help Determine Bore Size



Bore size is the ID of the cylinder barrel. Since you can't measure inside the cylinder, use the OD as a guide—bore size is about .125″-.25″ smaller than the cylinder OD.

Identify Bore Size and Stroke Length by Bimba Part Number

Find the numeric portion of the part number. The first two or three digits correspond to a bore size in the table. The remaining digits indicate stroke length.

Bimba Number	Bore Size	Bimba Number	Bore Size	Bimba Number	Bore Size
007	5/16″	06	7/8″	24	1 3/4″
01	7/16″	09	1 1/16″	31	2″
02	9/16″	12	1 1/4″	50	2 1/2″
04	3/4″	17	1 1/2″	70	3″

Examples:

SR-041-D — Bore Size = 3/4″, Stroke Lg. = 1″

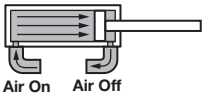
016-D — Bore Size = 7/16″, Stroke Lg. = 6″

170.5 — Bore Size = 1 1/2″, Stroke Lg. = 1/2″

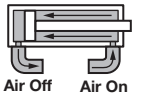
SR-090.75 — Bore Size = 1 1/16″, Stroke Lg. = 3/4″

Double Acting

Most of our cylinders are double acting. They use air to exert force in both directions to push and pull. Cylinders have two ports.



Air extends the rod.

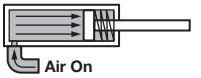


Air retracts the rod.

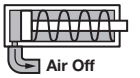
Single Acting

Single-acting cylinders use air to exert force in one direction and have a spring that returns the rod to its original position. They have one port. Choose from push-style cylinders and pull-style cylinders.

Push-Style Cylinders



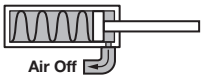
Air extends the rod.



A spring retracts the rod.

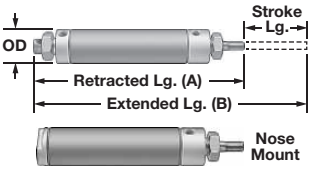
Pull-Style Cylinders

Air retracts the rod.



A spring extends the rod.

Double-Acting Round Body Air Cylinders



Create linear motion with the most popular of our air cylinders. Barrel and rod are 300 series stainless steel and end caps are aluminum. Force is given at 100 psi; max. pressure is 250 psi. Temperature range is –20° to 200° F. Ports are female. Cylinders are not repairable.

Universal-mount cylinders have threads on both ends to mount in a fixed position or you can use the hole on the back end to pivot mount. They come with two nuts and a pivot pin with retaining rings.

Nose-mount cylinders have threads on the rod end and come with a nut to mount in a fixed position.

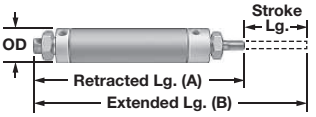
Metric Double-Acting Round Body Air Cylinders



Find the best fit for equipment with metric threads. Cylinders have a 300 series stainless steel barrel and rod and aluminum end caps. Force is given at 100 psi; max. pressure is 145 psi. Temperature range is 14° to 176°F. Cylinders are universal mount, so they have threads on both ends to mount in a fixed position or you can use the hole on the back end to pivot mount. They come with two nuts and a pivot pin with retaining rings. Ports are female. Cylinders are not repairable.

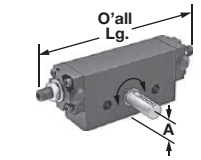
High-Torque Rotary Air Actuators



1/2″ and 3/4″ Bore Sizes

1 1/8″, 1 1/2″, and 2″ Bore Sizes

Designed to turn heavy loads, these rotary air actuators have rack-and-pinion gears that provide high torque output. Actuators are double acting, so they use air to exert force in both clockwise and counterclockwise directions. You can reduce the shaft rotation by as much as 30° to meet the requirements of your application—turn the screw on the end cap to adjust. Actuators have an aluminum body and a keyed shaft. Max. pressure is 150 psi. Temperature range is –20° to 200°F. Ports are 1/4 NPT female, unless noted.

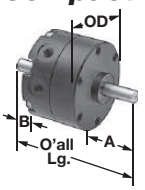
★ Ports are 10-32 UNF female. ■ Ports are 1/8 NPT female.

Compact Rotary Air Actuators



Use rotary motion to drive devices in tight spaces. These small actuators are double acting, so they use air to exert force in both clockwise and counterclockwise directions. They have an aluminum body and D-profile shafts. Max. pressure is 100 psi. Temperature range is 40° to 140°F. Ports are 10-32 UNF female, unless noted. Attach a sensor (sold separately) to activate relays and controllers.

To Order: Choose a shaft rotation: 90°, 180°, or 270°.

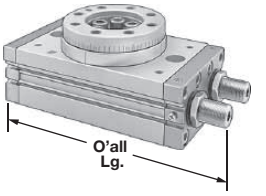
Choose an OD: 1.14″, 1.34″, 1.65″, 1.97″ — 6508K2

▲ 270° shaft rotation actuators have M3 female ports.

Adjustable-Angle Rotary Air Actuators



Turn the adjustment bolt on these actuators to set the rotation between 0° and 190° to meet your application requirements. They're double acting, so they use air to exert force in both clockwise and counterclockwise directions. Body is aluminum. Max. pressure is 145 psi. Temperature range is 32° to 140°F. Ports are 1/8 NPT female, unless noted. Attach a sensor (sold separately) to activate relays and controllers.

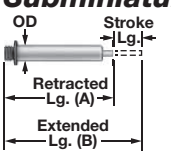
♣ Ports are 10-32 UNF female.

Subminiature Round Body Air Cylinders



At less than two inches in length, these cylinders actuate small devices in spots where other cylinders don't fit. They're single acting, push style—air extends the rod and a spring returns the rod to its original position. Barrel, end caps, and rod are 300 series stainless steel. Force is given at 100 psi; max. pressure is 150 psi. Temperature range is 30° to 230°F. Mount horizontally or vertically. Port is 3-56 UNF male; cylinders come with a barbed adapter for 1/16″ ID tubing. Cylinders are not repairable.

Stroke Lg.	*Length* (A)	(B)		
5/32″ Bore Size (0.19″ OD)—Force is 2 lbs.				
1/4″	1.06″	1.31″	7725K1	$21.27
1/2″	1.48″	1.98″	7725K2	24.10

Single-Acting Round Body Air Cylinders

More basic and cost effective than double-acting cylinders, these single-acting cylinders exert force in one direction and have a spring to return the rod to its original position. Barrel and rod are 300 series stainless steel and end caps are aluminum. Force is given at 100 psi; max. pressure is 250 psi. Temperature range is –20° to 200°F. Port is female. Cylinders are not repairable.

Push-style cylinders use air to extend the rod. *Pull-style* cylinders use air to retract the rod.

Universal-mount cylinders have threads on both ends to mount in a fixed position or you can use the hole on the back end to pivot mount. They come with two nuts and a pivot pin with retaining rings.

Nose-mount cylinders have threads on the rod end and come with a nut to mount in a fixed position.

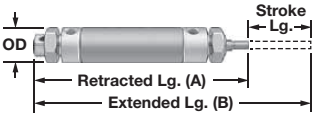
Sensor-Ready Round Body Air Cylinders



The magnetic piston inside these cylinders can activate relays and controllers when used with a sensor (sold separately). When the piston moves past the sensor, the sensor activates. You can use multiple sensors—attach one for each action to trigger.

Cylinders are double acting. Barrel and rod are 300 series stainless steel and end caps are aluminum. Force is given at 100 psi. Cylinders are universal mount, so they have threads on both ends to mount in a fixed position or you can use the hole on the back end to pivot mount. They come with two nuts and a pivot pin with retaining rings. Ports are female. Cylinders are not repairable.

Inch Sizes—Max. pressure is 250 psi. Temperature range is –20° to 200° F.

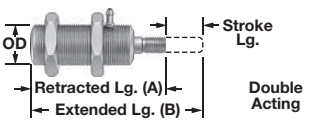
Miniature Threaded-Body Air Cylinders



These cylinders thread directly into your equipment, taking minimal space. They have a brass body, 316 stainless steel rod, and include two nuts for mounting, unless noted. Force is given at 100 psi; max. pressure is 125 psi. Temperature range is 0° to 220° F. Cylinders are not repairable.

Single-acting cylinders are push style—air extends the rod and cylinders have a spring that returns the rod to its original position. Port is 10-32 UNF female.

Double-acting cylinders exert force in both directions. One port is 10-32 UNF female and the second is barbed for 1/16″ ID tubing, unless noted.

Stroke Lg.	Length (A)	Length (B)	Single Acting		Double Acting	
1/4″ Bore Size (3/8″ OD, 3/8″-32 Threads)—Force is 5 lbs.						
1/4″	1.55″	1.8″	6604K11	$20.36	6604K21	$31.87
3/8″ Bore Size (1/2″ OD, 1/2″-32 Threads)—Force is 11 lbs.

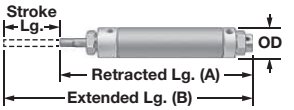
Stroke Lg.	Length (A)	Length (B)	Single Acting		Double Acting	
1/2″ Bore Size (5/8″ OD, 5/8″-32 Threads)—Force is 20 lbs.						
1/2″	2.05″	2.55″	6604K15	$35.43	6604K24	$52.23
1″	2.55″	3.55″	—	—	6604K25★	56.74

★ Includes one mounting nut. Both ports are 10-32 UNF female.

Cushioned Round Body Air Cylinders

Designed to keep the piston from slamming against the cylinder body, these cylinders have adjustable air cushions at each end to minimize wear and noise. Turn the screws to adjust the amount of cushion.

Cylinders are double acting. Barrel and rod are 300 series stainless steel and end caps are aluminum. Force is given at 100 psi. All are universal mount, so they have threads on both ends to mount in a fixed position or you can use the hole on the back end to pivot mount. They come with two nuts and a pivot pin with retaining rings. Ports are female. Cylinders are not repairable.



Inch Sizes—Max. pressure is 250 psi. Temperature range is –20° to 200°F. (For mounting attachments, see page 1045.)

Impact-Resistant Aluminum Round Body Air Cylinders

Built to withstand hard knocks, these cylinders have a thick barrel wall and are repairable. They have a magnetic piston so you can use them with sensors (sold separately) to activate relays and controllers. Cylinders are double acting. Barrel and end caps are aluminum, and rod is steel. Force is given at 100 psi; max. pressure is 145 psi. Temperature range is 40° to 140°F. Cylinders have mounting holes on both ends. Ports are female.

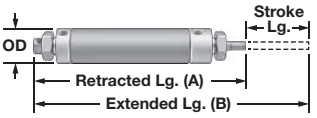
Round Body Air Cylinders for Washdown



Able to resist corrosive solutions and chemical environments, these cylinders withstand washdown conditions. Cylinders are double acting. Force is given at 100 psi. All are universal mount, so they have threads on both ends to mount in a fixed position or you can use the hole on the back end to pivot mount. They come with two nuts and a pivot pin with retaining rings. Ports are female. Cylinders are not repairable.

Stainless steel cylinders have excellent corrosion resistance and have a rod wiper to keep contaminants out. Barrel, rod, and end caps are 300 series stainless steel. Max. pressure is 250 psi. Temperature range is –20° to 200° F.

Sensor-ready acetal and stainless steel cylinders have excellent corrosion resistance at a lower cost than all-stainless cylinders. They have a magnetic piston so you can use them with sensors (sold separately) to activate relays and controllers. Cylinders have acetal end caps and a 300 series stainless steel barrel and rod. Max. pressure is 100 psi. Temperature range is 32° to 160° F.

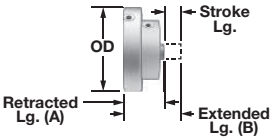
Round Body Air Cylinders for Narrow Spaces



Also known as pancake cylinders, these deliver as much force as other cylinders, but with a shorter stroke to function in small spaces. All are double acting. They have an aluminum body and a steel rod. Force is given at 100 psi; max. pressure is 150 psi. Temperature range is –40° to 250° F. Ports are female. Cylinders have holes for mounting.

Impact-Resistant Brass Round Body Air Cylinders

Not only are these cylinders repairable, thick walls make them impact resistant. All are double acting. Rod is 300 series stainless steel. Force is given at 100 psi. Ports are female.

Universal-mount cylinders have threads on both ends to mount in a fixed position or you can use the hole on the back end to pivot mount. They come with two nuts and a pivot pin with retaining rings. Max. pressure is 250 psi. Temperature range is 30° to 180° F.

Sensor-ready nose-mount cylinders have a magnetic piston so you can use them with a sensor (sold separately) to activate relays and controllers. They have threads and a nut on the rod end to mount in a fixed position horizontally or vertically. Max. pressure is 100 psi. Temperature range is 40° to 140° F.

Compact Nonrotating Tie Rod Air Cylinders

These cylinders have two parallel piston rods that prevent the head from twisting as they extend and retract. They pack force into a smaller footprint than our other tie rod cylinders. Cylinders are double acting. Barrel and rod are 300 series stainless steel. Tie rods and end caps are aluminum. Force is given at 100 psi; max. pressure is 200 psi. Temperature range is 0° to 150° F. Ports are female. Cylinders have holes for mounting.

Sensor-ready cylinders have a magnetic piston that can activate relays and controllers when used with one or more sensors (sold separately).

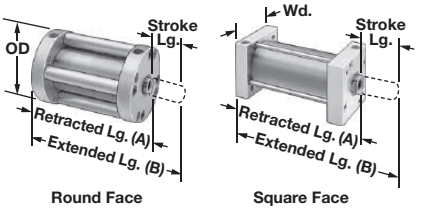
Compact Tie Rod Air Cylinders



Get the power and stroke of other tie rod cylinders in less than half the space. Cylinders are double acting; they use air to exert force in both directions. Force is given at 100 psi. Max. pressure is 200 psi, except the 2½" to 4" bore size square-face cylinders have a max. pressure of 150 psi. Ports are female. The back end must be mounted against a solid surface.

Round and Square Face—Cylinders have a 300 series stainless steel barrel and rod, and aluminum end caps. Temperature range is 0° to 150° F. *Round-face* cylinders have aluminum tie rods. *Square-face* cylinders have 300 series stainless steel tie rods.

Sensor-ready cylinders have a magnetic piston that can trigger one or more sensors (sold separately) to activate relays and controllers.

Impact-Resistant Round Face—Cylinders have a high-strength plastic composite barrel that doesn't dent. They have a 300 series stainless steel rod, and aluminum tie rods and end caps. Temperature range is –25° to 221° F.

Tie Rod Air Cylinders

Rods along the barrel of these cylinders secure the end caps and shield the barrel from impact. All are double acting; they use air to exert force in both directions. Force is given at 100 psi. Ports are female. Cylinders are repairable.

Standard cylinders with *3/4" and 1 1/8" bore sizes* have an aluminum body and steel end caps. Rod is 300 series stainless steel and tie rods are steel. Max. pressure is 150 psi and temperature range is 0° to 180° F. Cylinders with *1 1/4" to 4 1/2" bore sizes* have an aluminum body and end caps. Rod and tie rods are steel. Max. pressure is 250 psi and temperature range is 10° to 200° F.

Cushioned cylinders have adjustable air cushions that absorb piston impact to minimize wear and noise. Turn the screws to adjust the amount of cushion.

Sensor-ready cylinders have a magnetic piston so you can use them with sensors (sold separately) to activate relays and controllers.

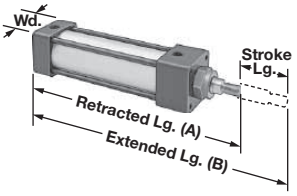
NFPA Tie Rod Air Cylinders



Made to fit the most common mounting footprint, these cylinders have an NFPA (National Fluid Power Association) industry-standard footprint, ensuring easy interchangeability. They have a magnetic piston so you can use sensors (sold separately) to activate relays and controllers. All are double acting; they use air to exert force in both directions. Force is given at 100 psi; max. pressure is 250 psi. Temp. range is –20° to 200° F. Ports are female. Cylinders are repairable.

Standard cylinders have an aluminum body and end caps. Rod and tie rods are steel.

Cushioned cylinders have adjustable air cushions that absorb piston impact to minimize wear and noise. Turn the screws to adjust the amount of cushion. *Standard cushioned* cylinders have an aluminum body and end caps. Rod and tie rods are steel. *Washdown cushioned* cylinders have an all-stainless steel exterior to withstand wet and corrosive environments. Body, end caps, rod, and tie rods are 300 series stainless steel.

Enclosed-Body Tie Rod Air Cylinders

An extruded-aluminum body means these cylinders have no open spaces for debris to collect. They're cushioned to absorb piston impact to minimize wear and noise, and have a magnetic piston so you can use them with sensors (sold separately) to activate relays and controllers. All are double acting; they use air to exert force in both directions. Body and end caps are aluminum. Force is given at 100 psi. Ports are female.

Standard cushioned cylinders have a screw at each port so you can adjust the amount of cushion. They have an NFPA (National Fluid Power Association) industry-standard footprint for easy interchangeability. Cylinders are repairable. *Inch sizes* have a steel rod. Max. pressure is 200 psi. Temperature range is 0° to 160° F. *Metric sizes* have a 431 stainless steel rod. Max. pressure is 145 psi. Temp. range is –4° to 175° F.

Self-adjusting cushioned cylinders have dynamic cushions that automatically adjust the amount of cushion based on changes in load and speed. Rod is steel. Max pressure is 174 psi. Temp. range is –4° to 176° F.

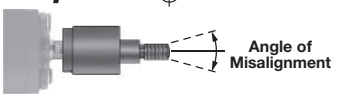
Rod Alignment Couplers



Increase cylinder life by fixing alignment problems between air or hydraulic cylinders and driven components. Couplers have a threaded end that moves to compensate for the angle of misalignment, reducing wear on cylinder bearings and seals. Couplers have a male and female end.

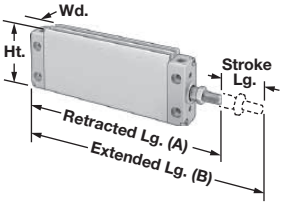
Thin-Profile Flexible-Mount Nonrotating Air Cylinders



Mount these cylinders wherever you need them—cylinders have holes on each side and the front, and attachments (sold separately) to provide many mounting options. Also nonrotating, these cylinders have a round piston rod that prevents twisting as it extends and retracts. Piston is magnetic, so you can use these cylinders with sensors (sold separately) to activate relays and controllers.

Cylinders are double acting; they use air to exert force in both directions. Body and end caps are aluminum, and rod is 300 series stainless steel. Force is given at 100 psi; max. pressure is 145 psi. Temperature range is 0° to 176°F. Ports are female. Cylinders are not repairable.

Short-Stroke Clamping Air Cylinders

Also known as air clamps, these cylinders are used to apply force in holding applications. All are single acting, push style—air extends the rod and a spring returns the rod to its original position. Body is aluminum and rod is steel. Max. pressure is 150 psi. Temperature range is –40° to 250°F. Port is 1/8 NPT female. Cylinders are not repairable.

Flexible-Mount Air Cylinders

Threaded through-holes in each corner allow you to mount these cylinders directly to equipment or mount with attachments (sold separately). All have a magnetic piston so you can use them with sensors (sold separately) to activate relays and controllers. Cylinders are double acting; they use air to exert force in both directions. Body is aluminum and rod is 300 series stainless steel. Force is given at 100 psi. Ports are female. Cylinders are repairable.

Standard cylinders have a max. pressure of 145 psi. Temperature range is 14° to 140°F.

Nonrotating cylinders have two parallel piston rods that prevent twisting as they extend and retract. Max. pressure is 150 psi. Temperature range is –25° to 250°F.

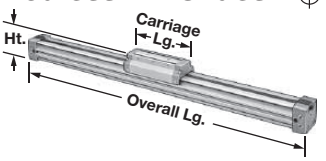
Sensors for Standard—Choose a reed sensor or 24V DC solid state sensor.
For reed, please specify 24/48/100V AC/DC or 24/100V DC with LED. For solid state, please specify NPN or PNP output 62245K9

Sensors for Nonrotating—Choose a 5-120V AC/DC reed sensor or 5-28V DC solid state sensor.
For solid state, please specify NPN or PNP output 6277T7

★ Sold individually; two are required. ■ For standard cylinders only.

Rodless Air Slides



With no external moving parts, these air slides provide a long stroke, but have a static footprint—only the carriage on top moves. They have a magnetic piston so you can use them with sensors (sold separately) to activate relays and controllers. Slides are double acting; they use air to exert force in both directions. Force is given at 100 psi; max. pressure is 115 psi. Ports are female. Slides are repairable.

Standard slides have adjustable air cushions that absorb piston impact to minimize wear and noise. Turn the screws to adjust the amount of cushion. Barrel, end caps, and slide are aluminum.

Low-profile slides have a shorter height than standard slides to fit in tight locations. Barrel is aluminum and end caps and carriage are plastic.

Standard—Temperature range is –22° to 176° F

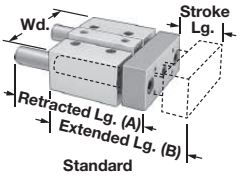
Air Slides



Standard

Adjustable Stroke Length

Convenient for use with devices such as grippers and printing heads, these air slides have a nonrotating head that provides steady motion and a large mounting area. Air slides have two guide rods parallel to the piston that keep the head from twisting as it extends and retracts. They have a magnetic piston so you can use them with sensors (sold separately) to activate relays and controllers. All are double acting; they use air to exert force in both directions. Body is aluminum and rods are 300 series stainless steel. Force is given at 100 psi. Ports are female.

Standard air slides have a max. pressure of 150 psi. Temperature range is –20° to 180° F. Air slides are repairable.

Adjustable stroke length air slides have adjustable shaft collars on the guide rods so you can fine-tune the stroke length based on changes in your application. Max. pressure is 250 psi. Temperature range is –10° to 165° F. Air slides are not repairable.

Hydraulic Pressure Regulators

Control pressure in a hydraulic line by redirecting excess pressure back into your hydraulic reservoir. These regulators have a cast iron body and 1/4 NPT pressure gauge port. Maximum temperature is 158° F. Ports are female.

Port Size, NPT	Max. Flow, gpm	Max. Pressure, psi	Regulating Range, psi	Lg.	Wd.	Ht.

Color-Set Adjustable Flow Control Valves

Five colored rings on the valve stem represent different flow rates. Adjust the knob until you see the color of the flow rate you need. Ports are female. Note: NPTF threads (Dryseal) are compatible with NPT threads.

Valves **for air and hydraulic systems** are brass. Valves **for hydraulic systems** are steel.

Flow control valves regulate flow rate in both directions. **Flow control valves with check valve** regulate flow rate in the flow-control direction (inlet to outlet) and let air or fluid flow freely in the other direction. Note: Flow control valves do not regulate pressure.

Hand-Operated Hydraulic Directional Control Valves

Control hydraulic flow with a pull on the hand lever. A spring returns the valve to its original position once you let go of the lever. They're 4-way valves for use with double-acting cylinders. Body is cast iron and ports are female.

No. of Ports	Positions No.	Positions Center	Port Size, NPT	Max. Flow, gpm	Max. Pressure, psi	Lg.	Wd.	Ht.		
4	2	—	3/8	25	3,000	6 7/8"	2 7/8"	10"	4393T1	$148.98
4	3	Closed	3/8	25	3,000	6 7/8"	2 7/8"	10"	4393T2	148.98

Build-Your-Own Solenoid Hydraulic Directional Control Valves

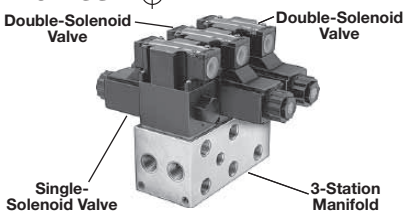
Valves require a base or manifold (sold separately). Control these electrically operated valves remotely or use them in an automated system. They're 4-way valves for use with double-acting cylinders. All have a cast iron body and IP65-rated conduit terminal. They operate on 120 volts AC.

Valves conform to NFPA D03 or D05 mounting patterns (also known as ISO sizes 3 and 5). D03 trade-size valves draw 33.5 watts of power and D05 trade-size valves draw 38 watts of power.

Single-solenoid valves move into position when electrical current is supplied; a spring returns the valves to their original position once current is removed.

Double-solenoid valves move into position when electrical current is supplied to the first solenoid and to another position when current is supplied to the second solenoid. A spring returns the valves to their original position once current is removed.

For information about directional control valves, see page 1033.



Valves—To Order: For double-solenoid valves, please specify center position: closed or exhaust.

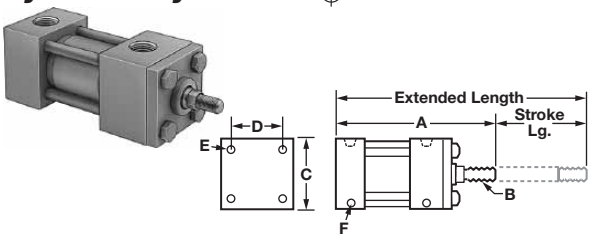
Trade Size	No. of Ports	No. of Positions	Max. Flow, gpm	Max. Pressure, psi		
Single Solenoid						
D03	4	2	16.8	4,500	49995K123	$146.34
D05	4	2	23.8	4,500	49995K113	207.32
Double Solenoid						
D03	4	3	16.8	4,500	49995K37	$182.93
D05	4	3	26.4	4,500	49995K57	241.46

Single Station Bases and Manifolds—To Order: For manifolds, please specify number of stations: 2 or 3.

Ports are female. Use **single station bases** to mount a single valve. Bases are cast iron. **Manifolds** allow you to have a single hydraulic source and tank connection for multiple valves. Manifolds are aluminum.

For Trade Size	Single Station Bases Port Size			Manifolds Port Size		
D03	3/8 NPT	49995K751	$48.78	1/4, 3/8, 1/2 NPTF	49995K28	$110.60
D05	1/2 NPT	49995K851	85.37	1/4, 1/2, 3/4 NPTF	49995K99	181.65

Hydraulic Cylinders



For easy interchangeability, these cylinders comply with NFPA (National Fluid Power Association) footprints. They're double acting—they have two hydraulic pressure ports: one to extend in the "push" direction and another to retract in the "pull" direction. Ports are female. Cylinders have steel end caps and a chrome-plated steel piston rod.

Large-Footprint Cylinders—Also meet JIC (Joint Industrial Congress) industry standard mounting footprints. They have a heavy-wall steel body. Maximum pressure is 2,500 psi. Temperature range is –10° to 165°F.

Medium-Footprint Cylinders—Have NFPA MS4-type tapped mounting holes and a brass body. Maximum pressure is 1,500 psi for the cylinder with a 1½" bore size and 1,200 psi for the cylinder with a 2" bore size. Temperature range is 0° to 165°F.

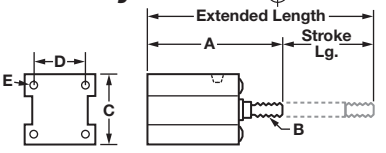
★ Pivot pin is not included; order separately. ■ Designed for use with rod clevis; does not mount to cylinder back.

Compact Hydraulic Cylinders



When space is limited, choose these small-footprint cylinders. They're double acting—they have two hydraulic pressure ports: one to extend in the "push" direction and another to retract in the "pull" direction. Ports are female. Cylinders have an aluminum body and chrome-plated steel piston rod. Maximum pressure is 2,320 psi. Temperature range is 14° to 140°F.

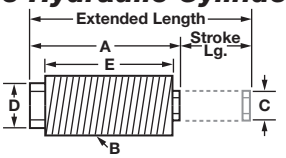
Miniature Hydraulic Cylinders

Cylinder



Mounting Block

Jam Nut

Produce high force in tight spaces from a small, easy-to-mount threaded-body cylinder. They're single acting—they have one hydraulic pressure port to extend in the "push" direction; an internal spring retracts in the "pull" direction. Ports are female. The cylinder body and piston rod are steel. Maximum pressure is 5,000 psi. Temperature range is –40° to 160°F.

When using a **mounting block**, a **jam nut** is required. Mounting blocks and jam nuts are steel. Mounting blocks have two unthreaded ⅜" diameter mounting holes, except 6297K35 has four holes.

Hydraulic Reservoirs and Accessories

Reservoirs

Use to store hydraulic fluid. Choose a reservoir with a capacity about three times your requirement to allow for heat dissipation. All have an oil level gauge, breather vent, female drain port with male plug, and a temperature gauge with 0° to 250° F readout. They're made of steel. Connect pipes with the required suction flanges (sold separately).

Reservoirs have a removable top with a gasket. The 8- and 10-gallon reservoirs have a 6″ dia. cleanout cover.

On **reservoirs with divider**, the return side is separated from the inlet side to allow particles to settle before return fluid mixes with inlet fluid. It also prolongs pump life. The 20- and 30-gallon reservoirs have a removable top. The 40-gallon reservoir has two 6″ dia. cleanout covers, and the 60- and 100-gallon reservoirs have two 12″ dia. cleanout covers.

Reservoir

Reservoir with Divider

Breather Vents

Breather vents provide a filler port for reservoirs while allowing a free flow of fresh air. All have a 40-micron filter.

Vents with *NPT threads* are plastic. *Flange-mount* vent has a chrome-plated steel cap, nylon strainer basket, and rubber gasket. A 2 1/8″ dia. mounting hole is required. Mounting screws included.

Breather Vent with NPT Threads

1/2 NPT Male Threads	62875K11	$5.83
3/4 NPT Male Threads	62875K12	5.83
Flange Mount	62875K13	12.54

Pipe Suction Flanges

Seal pipes that pass through the top plate of your reservoir. Each flange has a steel top and bottom plate, internal washer, and gasket. A 4 5/16″ dia. mounting hole is required. Mounting screws included.

For Pipe Size		
1/2	62875K21	$9.43
3/4	62875K22	9.43
1 1/4	62875K23	9.37
1 1/2	62875K24	11.80
2	62875K25	11.80

All-in-One Hydraulic Power Units

You'll get a fixed-displacement hydraulic gear pump, AC motor, reservoir, breather vent, and connections—all in one unit. Pump housing is aluminum. Motor is totally enclosed fan cooled and has a steel housing. Choose a unit with a reservoir capacity that's about three times your requirement to allow for heat dissipation. Ports are female. All units must be hardwired.

Compact power units have a 3/8 NPT outlet port and a 1/4 NPT return port in the base. They're wired for 115 volts AC.

Power units include a suction strainer and return filter to protect the pump from contamination, a pressure gauge, and an oil gauge with thermometer. Reservoirs have 1 1/16″-12 UN/UNF outlet and return ports and a 3/4 NPTF (Dryseal) spare return port, except the 0.9- and 1.3-gallon units have 7/8″-14 UN/UNF outlet and return ports and a 1/2 NPTF (Dryseal) spare return port.

■ Amps listed are at 230 volts AC for single-phase units; 460 volts AC for three-phase units.

Hydraulic Motors

When air motors are not powerful enough and electric motors can't be used for safety reasons, choose these hydraulic motors. They produce rotary power at about the same rpm, but with much greater torque than similar-sized air-powered motors. All have a roller-vane design, which delivers high torque and efficiency. They operate in both clockwise and counterclockwise rotation. Shaft diameter is 1″, shaft length is 1.52″, and body diameter is 3.76″. Motors have a flange with two 17/32″ mounting holes. Ports are 7/8″-14 UN/UNF female. Minimum oil viscosity is 50 SSU (Saybolt Seconds Universal). Housing is cast iron.

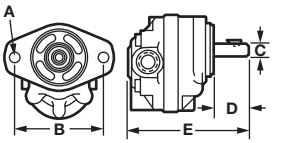
Hydraulic Pumps

SAE-AA

SAE-A

SAE-B

4F17



Generate pressure and flow in a hydraulic system with these pumps. All have female ports and shafts with keyways.

Pumps must be combined with a motor (not included). Pump-to-motor mounting adapters are sold below. All have an aluminum housing and two bolt holes. *SAE-B* pumps have cast iron end covers.

Pump/motors operate as a pump when connected to a motor with a non-hydraulic power source, or as a hydraulic motor when connected to another pump in a hydraulic system. They rotate clockwise and counterclockwise. All have a cast iron housing and four bolt holes.

Hydraulic Accumulators

Bladder Style

Diaphragm Style

Piston Style

Increase the efficiency of your hydraulic system by supplementing pump flow and pressure, absorbing shock, and compensating for leakage. Accumulators also provide auxiliary hydraulic pressure during pump failure. Housing is steel and ports are female. For safety, accumulators can't be disassembled under pressure.

Charged accumulators include a 1,000-psi charge of nitrogen, except 1- to 5-gallon models include a 2,100-psi charge.

Bladder-style accumulators have a replaceable Buna-N bladder bag and Buna-N seals. They must be mounted within 25° of vertical. Accumulators and replacement bladder bags are interchangeable with Accumulators Inc., Bosch, Greer, Hydac, Oil Air, Parker, and Vickers models that have the same capacity, body diameter, and stem size.

Diaphragm-style accumulators have a Buna-N diaphragm bag, are completely sealed, and can be mounted in any orientation.

Piston-style accumulators provide high flow rates and can be mounted in any orientation. They have a 2″ bore and Buna-N seals.

Use the **charging and gauging kit** to increase or decrease the charge of accumulators. It includes a 10-ft. hose with fittings, adapter with gas valve, bleeder valve, gas chuck, and pressure gauge.

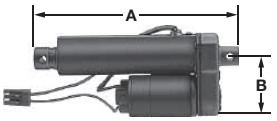
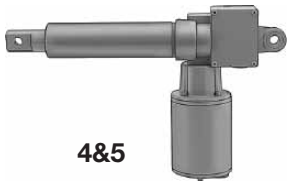
Electric Actuators



1

2

3



4&5

Actuators provide consistent, repeatable push/pull motion. These are Acme-screw driven and include an enclosed electric motor with thermal overload protection, except 12 volt DC high-force actuators with limit switches have fuse overload protection. Components are in a corrosion-resistant aluminum housing that protects from dust and dirt. Use clevis pins to connect actuators (see page 3388-3391 for clevis pins). They must be hardwired.

On **standard actuators with limit switches** you can stop the actuator at either end of the stroke.

High-force actuators hold their load, even when the power is off. On actuators *with limit switches* you can stop the actuator in any position. Actuators *with mechanical overload protection* have a slip clutch that prevents the motor from overheating. Set it to slip at any capacity down to 50 lbs.

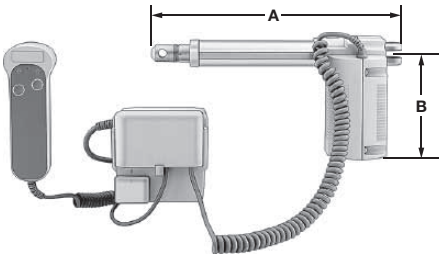
Plug-and-Go Electric Actuators and Controls



High Force

High Force for Washdown Environments

Hand Switch for High Force Actuator for Washdown Environments

No programming or hardwiring is required for reliable push/pull motion. These actuators have an electric motor in a plastic housing. Use clevis pins to connect actuators (see pages 3388-3391 for clevis pins). Note: A complete unit consists of an actuator, a control box, and a hand switch (each sold separately below).

High Force—Acme-screw driven.

High Force for Washdown Environments—Have a housing that protects against dust and power jets of water. All are lead-screw driven.

Control boxes provide 24 volts DC output and control up to four actuators individually. They operate on 120 volts AC. The control box for *high-force actuators for washdown environments* has integrated overload protection.

Switches have extend and retract buttons.

Miniature Mechanical Overload Protection Couplings

Standard

Remotely Adjustable

In the event of excess torque, these couplings slip to protect motors and drivetrains and ensure safe operation. They resume driving once the load has been reduced. You can adjust the torque level at which the clutches slip without removing them from your shaft. They drive and slip in both clockwise and counterclockwise directions.

Maximum torque for **standard** couplings is at the maximum continuous rpm of 50.

Remotely adjustable couplings are air actuated so you can adjust the torque—even during operation. They're often used in automated systems. The air inlet connections are 10-32 UN/UNF female. Maximum torque is at the maximum psi of 100.

Miniature Electromagnetic Overload Protection Couplings

Use with an overload sensor in an automated system to instantly disconnect the power to prevent damage. These couplings also accelerate loads from zero to full speed in less than three milliseconds when the power is turned on. These shaft-to-gear couplings drive in one direction only. They operate on 24 volts DC.

Long Lasting Magnetic Overload Protection Couplings

Standard

With Shaft

Also known as hysteresis clutches, these couplings use magnetic force to brake, control tension, and prevent torque overload. They have few moving parts, so they last longer than mechanical couplings. Twist the adjustment ring to set the torque within the range listed, then lock the ring in place with the included set screw. These shaft-to-gear couplings work in both clockwise and counterclockwise directions.

Torque Adjustment Range, in.-lbs.	Max. rpm	O'all Dia.	O'all Lg.	Mounting Holes	Choose a Shaft Dia.

Electromagnetic Tensioning, Holding, and Stopping Devices

When the power is turned on, magnetic force creates drag to slow or stop the motion of your drive system. These devices are also known as electric hysteresis brakes. Use them with a current-limiting transformer (see page 986) to adjust the electrical current, which controls the amount of torque applied. These shaft-to-gear devices work in both clockwise and counterclockwise directions. They operate on 24 volts DC.

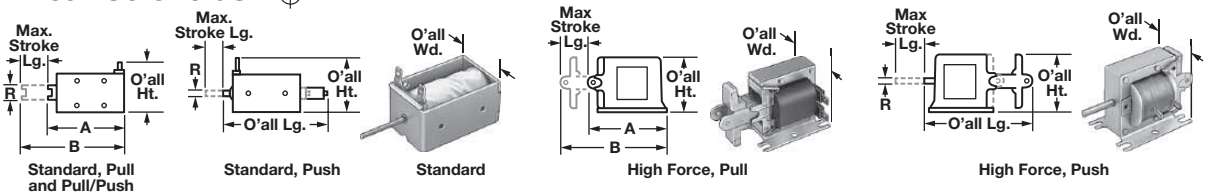
Linear Solenoids



Create linear motion economically with one of these open-frame solenoids. They have a steel body and lug terminals, unless noted. Mount at any angle. Components are UL recognized, unless noted.

Pull solenoids exert force when the rod retracts.

Push solenoids exert force when the rod extends.

Pull/push solenoids exert force when the rod retracts and extends.

Standard solenoids include a spring and retaining ring that you can use to return the rod to its original position, except the pull/push solenoid, which doesn't require a spring. Max. temp is 266° F, unless noted.

High-force solenoids draw more power than standard solenoids so they can deliver higher force. They also have a laminated rod that minimizes friction during operation. Solenoids require a spring (not included) to return the rod to its original position. Max. temperature is 221° F.

Max. Stroke Lg.	Length: Retracted (A)	Length: Extended (B)	Length: O'all	Overall: Wd.	Overall: Ht.	Rod Size (R)	Intermittent Use: Force, oz. @ 50% Stroke Lg. ★ Has wire leads. Not UL recognized. Max. temperature is 221° F.

Sealed Linear Solenoids

Spend less time on solenoid maintenance in dirty environments—these have a closed steel housing that keeps dust out. Mount at any angle.

Standard solenoids include a spring with a retaining ring to return the rod to its original position. They have wire leads and are UL recognized. Max. temperature is 266° F. *Pull* solenoids exert force when the rod retracts. *Push* solenoids exert force when the rod extends.

Water-resistant solenoids are rated IP65 for protection from dust and spraying water. They can be used to pull or push. To pull, install them with the connector pins facing your device; to push, install them facing away. Solenoids have a built-in spring that returns the rod to its original position. The rod has M5 threads. They have two-pin Deutsch-style plugs (for connectors, see 6084T on page 811). Max. temperature is 356° F.

Extended-life solenoids have a PTFE-coated rod to minimize friction and an internal cushion to reduce shock. They all pull, exerting force when the rod retracts. Each requires a spring (not included) to return the rod to its original position. All have wire leads. Components are UL recognized. Max. temperature is 221° F.

About Electric Motors

When replacing a motor, use the information on your motor's nameplate to guide your selection. Although each manufacturer displays information differently on the motor nameplate, the specifications below are the most important to consider.

Specification	Example
Voltage—Match the voltage.	VOLTS 208-230/460
Phase—Match the phase.	PH 3
Frame Size—Match the NEMA frame number.	FRAME 56
Horsepower—Select the same hp or higher.	H.P. 3/4
Max. rpm—Select the same rpm ±5%.	R.P.M. 1725
Enclosure Type—Match the enclosure type.	ENCL TEFC

Understanding Enclosure Types

ODP (open drip proof) enclosures are for relatively clean, dry, well-ventilated indoor locations.

TEFC (totally enclosed fan cooled) enclosures offer more protection than ODP enclosures. They are not airtight, but can be used in dirty, dusty, and damp environments. They have an external fan that blows air over the outside of the motor for cooling.

TENV (totally enclosed non-ventilated) enclosures are similar to TEFC enclosures, except they do not have a fan. They rely on air circulation from the motion of the motor for cooling.

TEAO (totally enclosed air over) enclosures are dust-tight. Designed for use with blowers and fans, mount motors in the airflow of the blower or fan they're driving.

AC Motors

For technical drawings and 3-D models, go to mcmaster.com.

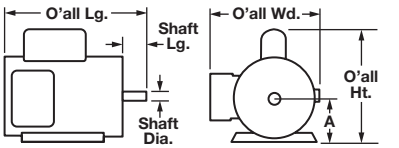
Base-Mount AC Motors

ODP Enclosure

TEFC Enclosure

TEAO Enclosure

TENV Enclosure



Replace old base-mount motors to keep your equipment moving. Motors are rated for continuous duty and mount at any angle. They have wire leads, unless noted. Shaft is keyed and comes with key stock, except NEMA 48 and 48Z motors have a D-profile shaft. You can wire for clockwise or counterclockwise rotation; instructions are included.

Enclosure is steel and has a welded base, unless noted. Motors with a max. temperature of 266°F meet insulation Class B; those with a max. temperature of 311°F meet insulation Class F. They're UL recognized and CSA certified.

To use a motor with a variable frequency drive (AC motor speed control), choose a three-phase motor that's inverter rated. For Programmable Three-Phase AC Motor Speed Controls, see page 938.

Motors with overload protection turn off in overload conditions to prevent motor damage. **Manual** overload protection must be reset manually to start the motor after it cools. **Automatic** overload protection starts the motor automatically after it cools.

Motors with a **vibration-damping base** have rubber rings between the base and enclosure to minimize vibration.

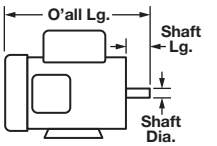
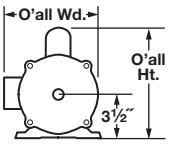
★ Enclosure has a vibration-damping base. ■ Motor has screw terminals. ▲ Enclosure is cast iron.

Base/Face-Mount AC Motors

TEFC Enclosure

TENV Enclosure





Select a motor that fits many applications—these mount from the base or face and at any angle. They're rated for continuous duty and have wire leads. Enclosure is steel and has a welded base. Shaft is keyed and includes key stock. You can wire for clockwise or counterclockwise rotation; instructions are included. All are UL recognized and CSA certified.

Choose a three-phase motor, which is inverter rated, if you want to use a variable frequency drive (AC motor speed control). For Programmable Three-Phase AC Motor Speed Controls, see page 938.

Washdown motors have an epoxy-coated enclosure, neoprene rubber gaskets, and removable drain plugs. They meet IP55 for protection from water projected from a nozzle.

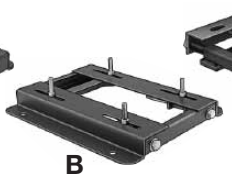
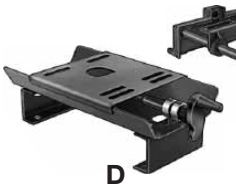
Adjustable Motor-Mounting Bases





Increase energy efficiency in belt-driven systems while reducing wear on components—use one of these steel bases to adjust your motor position to get the proper belt tension.

Bases for constant-speed applications keep your motor in a fixed position while operating. Mount horizontally.

Bases for variable-speed applications allow movement while operating to compensate for vibration and varying loads. They're often used for automatic belt tensioning with spring-loaded pulleys in variable-speed drive applications. *Styles C, D, and F* mount at any angle. *Style E* mounts horizontally and vertically.

Face-Mount AC Motors

Also known as C-face motors, these bolt directly to your equipment at any angle. They're rated for continuous duty and have a steel enclosure and wire leads. Shaft is keyed and comes with key stock. You can wire for clockwise or counterclockwise rotation; instructions are included. Motors with a max. temperature of 266° F meet insulation Class B; those with a max. temperature of 311° F meet insulation Class F. They're UL recognized and CSA certified.

For use with a variable frequency drive (AC motor speed control), choose a three-phase motor that's inverter rated.

Base/Face-Mount DC Motors

With two location options for any-angle mounting, you can put these motors to work in a variety of equipment configurations. They're rated for continuous duty and have wire leads. The enclosure is steel and aluminum and has a removable base. Shaft is keyed and comes with key stock. Wire for clockwise or counterclockwise rotation; instructions are included. Motors meet insulation Class F for a max. temperature of 311° F. They're UL recognized and CSA certified.

To convert AC power to DC power, see AC to DC transformers on pages 985 and 986.

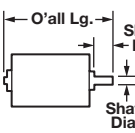
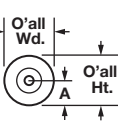
Compact DC Motors

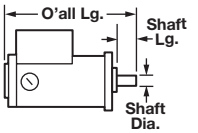
Round Face

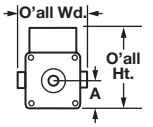
With Mounting Threads





Square Face





Power small machinery in spaces where other motors won't fit. Motors are rated for continuous duty and have a steel enclosure and wire leads, unless noted. You can wire for clockwise or counterclockwise shaft rotation; instructions are included. Mount motors at any angle, except high-performance motors mount horizontally.

To control motor speed, see AC to DC Motor Speed Controls on page 938. To convert AC power to DC power, see AC to DC transformers on pages 985 and 986.

Round-face motors have a solid shaft (no keyway). **High-performance round-face** motors have less torque loss at high speeds than other compact motors.

Square-face motors have a D-profile shaft. They're UL recognized, CSA certified, and CE marked.

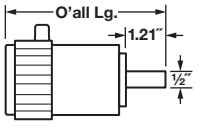
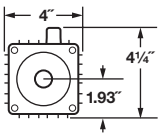
★ Motor has lug terminals.

Speed-Control Motors

Control Face





Maintain speed automatically. These motors come with a speed control with a feedback sensor that adjusts power to maintain your set speed. They combine the speed control characteristics of permanent magnet brushless DC motors with the convenience of AC power—an integrated inverter means they operate on 120 volts AC.

Motors are rated for continuous duty. They mount at any angle and have a 9-ft. cord with plug. Shaft is keyed and comes with key stock. Use the switch on the speed control to set clockwise or counterclockwise rotation. Enclosure is steel and aluminum and meets IP50 for dust protection.

All have manual overload protection—an LED on the speed control indicates when the overload protection is triggered; use the switch to reset. Control also has an on/off switch and a speed adjustment knob. Panel mount the control up to 10 feet from the motor—it comes with a 10-ft. cable for connection. Control fits in a 4″ Wd. × 2⅞″ Ht. panel opening.

Position-Control DC Motors

Also known as stepper motors, these motors turn their shaft in discrete increments for precise position control. Each has a solid shaft (not keyed) that can turn clockwise or counterclockwise. Motors have an aluminum and steel enclosure, ball bearings, and wire leads. They're rated for continuous duty and mount at any angle.

Motors, Drivers, and Controllers

Motors have a 1.8° full step. They require drivers and/or controllers (sold separately) to operate. All meet insulation Class B with a max. temperature of 266° F.

Drivers convert voltage into pulses that rotate the motor shaft. All drivers require a controller, PLC, or computer to function. They come with instructions and a data cable, unless noted. *Drivers for NEMA 8, 11, 14, and 17 motors* step down to 0.23°, unless noted. *Drivers for NEMA 23 and 34 motors* step down to 0.007°.

Controllers store programs to run the drivers. They have three input ports and two output ports, unless noted. They come with instructions and a data cable. *Controllers for NEMA 8, 11, 14, and 17 motors* store up to 16 programs. They have a built-in driver and step down to 0.007°. *Controller for NEMA 23 and 34 motors* stores 2 programs that it can run simultaneously. It requires a driver to operate (sold separately).

★ Driver steps down to 0.007°. ■ Controller has two input ports and four output ports. ▲ Data cable not included.

Motors with Integrated Driver and Controller

A convenient all-in-one solution, these motors store up to 16 programs and come with instructions and a cable for connection to your computer. They have a NEMA 17 frame and meet insulation Class B with a max. temperature of 266° F.

Compact Square-Face DC Gearmotors

Drive low-speed, high-torque applications in small spaces. Gearmotors combine a motor and speed reducer to lower speed and increase torque. They're rated for continuous duty and mount at any angle. Shaft has a D-profile and can be wired for clockwise or counterclockwise rotation. Gearmotors have a die-cast zinc enclosure and lug terminals. They meet insulation Class B for a max. temperature of 266° F.

To control motor speed, see AC to DC Motor Speed Controls on page 938. To convert AC power to DC power, see AC to DC transformers on pages 985 and 986.

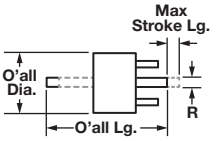
Compact Linear Solenoids



A thin profile allows these solenoids to fit well in narrow spaces. You can use them to push or pull—use the side with the unthreaded rod (R) and two mounting studs to push or use the opposite side with the threaded rod to pull. Solenoids have a steel body and wire leads. They require a spring (not included) to return the rod to its original position. Max. temperature is 221° F. Mount at any angle. Solenoids are rated IP51 for protection from dust and dripping water. Components are UL recognized.

To Order: Please specify 12 or 24 volts DC.

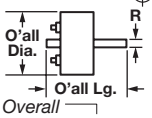
Rotary Solenoids



If your application requires rotary motion, take one of these solenoids for a spin. They're rated IP51 for protection from dust and dripping water. Solenoids have a steel body and wire leads. They have a built-in spring that returns the rod to its original position. Max. temperature is 221° F. Mount at any angle.

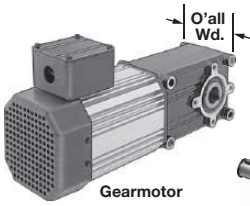
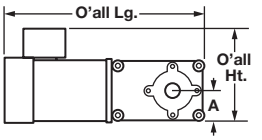
AC Gearmotors





Optional Shaft

A motor and speed reducer in one, these gearmotors have hypoid gears for energy-efficient operation. You can use them to turn a shaft on your equipment or add a keyed shaft (sold separately). Wire for clockwise or counterclockwise rotation; instructions are included. Gearmotors are rated for continuous duty and mount at any angle.

Enclosure is anodized aluminum and rated IP54 for protection from dust and splashed water. It meets insulation Class F with a max. temperature of 311° F. Gearmotors have wire leads and are inverter rated so you can use them with a variable frequency drive (AC motor speed control). Components are UL recognized.

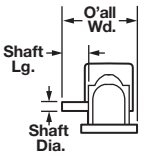
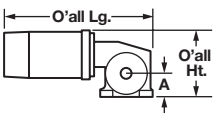
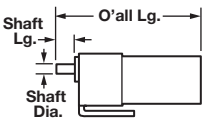
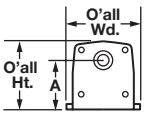
DC Gearmotors





Right-Angle Shaft





Parallel Shaft

Convert speed to torque to get the power you need—gearmotors are a motor and speed reducer in one. They operate on 90 volts DC, are rated for continuous duty, and have wire leads. Enclosure is steel and aluminum. Shaft is keyed and comes with key stock. You can wire for clockwise or counterclockwise rotation; instructions are included. Mount at any angle with the motor at the same level or above the speed reducer. Components are UL recognized.

To control motor speed, see 7793K on page 938. To convert AC power to DC power, see AC to DC transformers on pages 985 and 986.

Right-angle shaft gearmotors transmit motion at a 90° angle from the motor.

Parallel-shaft gearmotors transmit motion inline with the motor.

Compact AC Gearmotors

Sized for small spaces, use these gearmotors to power equipment in tight quarters. Each has a 115 volt AC, single-phase motor matched with a speed reducer to lower speed while increasing torque. They have a D-profile shaft that rotates clockwise (when facing the shaft end).

Gearmotors are rated for continuous duty, have automatic overload protection, and mount at any angle. They have a die-cast zinc housing, an integral fan, and wire leads. All meet insulation Class B with a max. temperature of 266°F. Gearmotors are CSA certified and have UL recognized components.

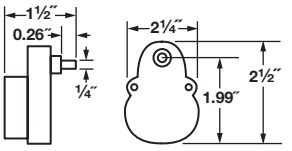
Constant-Speed AC Gearmotors



Achieve precise, constant speed for timing and positioning applications. Also known as synchronous gearmotors, these gearmotors use a frequency of 50/60 Hz to maintain speed and torque. They have a 110 volt AC, single-phase motor that's rated for continuous duty. Shaft has a D-profile and rotates clockwise (when facing the shaft end).

Gearmotors have a zinc-plated steel housing with two 0.14″ mounting holes. They have wire leads and mount at any angle. All meet insulation Class A with a max. temperature of 221°F. Components are UL recognized.

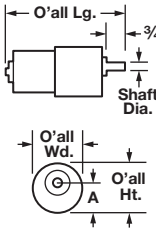
Compact Round-Face DC Gearmotors



Power small machinery in spaces where other gearmotors won't fit. Gearmotors pair a motor with a speed reducer to lower speed while increasing torque. They're rated for continuous duty and have wire leads, unless noted. Gearmotors have a yellow chromate steel enclosure. Shaft has a D-profile and can be wired for clockwise or counterclockwise rotation. Mount at any angle.

Extended-life gearmotors have ball bearings that withstand heavier loads than sleeve bearings for a longer service life.

To control motor speed, see 7729K on page 937. To convert AC power to DC power, see AC to DC transformers on pages 985 and 986.

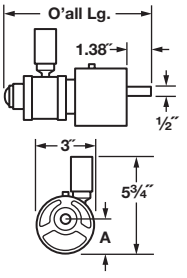
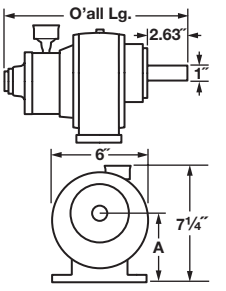
■ Has lug terminals.

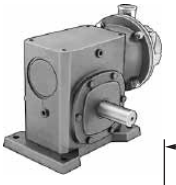
Air-Powered Gearmotors

Parallel Shaft, Face Mount

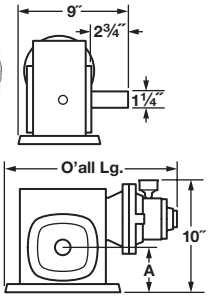


Parallel Shaft, Face/Base Mount





Right-Angle Shaft, Base Mount



With a motor and speed reducer in one, you can use these gearmotors in air-powered applications to slow speed and increase torque. They require lubricated, filtered air and come with a muffler to reduce noise and filter exhaust air. Set for clockwise or counterclockwise rotation. Enclosure is iron.

Parallel-shaft gearmotors transmit motion inline with the motor. Mount with the shaft parallel to the ground or facing down. *Face mount* have a D-profile shaft. *Face/base mount* have a keyed shaft and come with key stock.

Right-angle shaft gearmotors transmit motion at a 90° angle from the motor. Shaft is keyed and comes with key stock. Mount with the shaft parallel to the ground.

Compact Air-Powered Gearmotors

Small, but mighty, these gearmotors pair an air-powered motor with a speed reducer to lower speed while increasing torque. They require lubricated, filtered air. They can be set for clockwise or counterclockwise shaft rotation; instructions are included. Mount at any angle.

Gearmotors with **push-to-connect tube inlet** have a stainless steel and aluminum enclosure and a D-profile shaft.

Gearmotors with **threaded inlet** have a steel enclosure and a keyed shaft that comes with key stock.

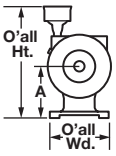
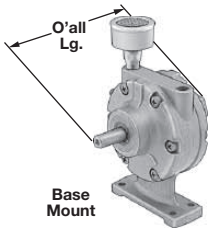
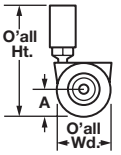
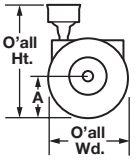
Air-Powered Motors









A safe alternative to electric motors for use in harsh environments, air-powered motors are spark-free and remain cool, even under continuous load. Motors require filtered, water-free, lubricated air, unless noted. All have an iron and aluminum enclosure and include a muffler to reduce noise and filter exhaust air. Mount at any angle. Motors with a keyed shaft come with key stock. Motors with reversible shaft rotation can be set to turn clockwise or counterclockwise; instructions are included.

Base-mount motors have an integral base for mounting.

Hub-mount motors have a raised hub around the bottom of the shaft. Use a clamp-on shaft collar (not included, see 9684T on page 1228) or a mounting bracket (sold separately) to mount around the hub.

Face-mount motors bolt directly to your equipment. Motors with a NEMA frame size meet NEMA specifications.

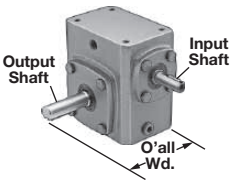
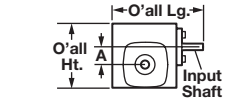
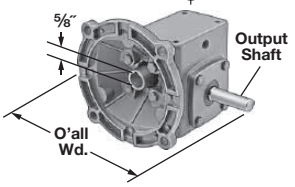
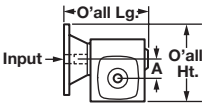
Right-Angle Speed Reducers





Shaft Input, Left-Hand Output Shown





NEMA 56C Motor Frame Input, Right-Hand Output Shown

Transmit motion from your motor at a 90° angle while reducing speed and increasing torque. Speed reducers accept clockwise or counterclockwise input rotation. Shafts are keyed and come with key stock. Enclosure is iron. Mount with the shaft parallel to the ground. All speed reducers require lubrication (sold separately).

Speed reducers with **shaft input** require a coupling (not included) to connect to your motor.

Speed reducers with **NEMA 56C motor frame input** have a flange that fits a NEMA 56C motor frame.

Optional mounting bases allow you to mount speed reducers to machinery. They come with four bolts.

To Order: Please specify right-hand or left-hand output shaft location. (The output shaft location is the relative position when you're facing the input shaft.)

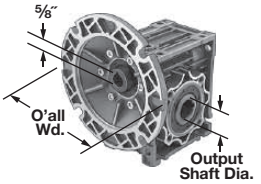
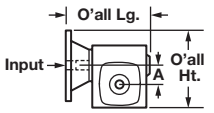
Flexible-Mount Right-Angle Speed Reducers





Optional Output Shaft

No need to choose sides—these speed reducers have both a right-hand and left-hand output so you can switch the configuration to meet your changing needs. They transmit motion at a 90° angle while reducing speed and increasing torque. Use them to turn a shaft on your equipment or add an output shaft (sold separately).

Speed reducers accept clockwise or counterclockwise input rotation and mount to a NEMA 56C motor. The left-hand output turns in the same direction as the input. The right-hand output turns in the opposite direction as the input. Enclosure is aluminum. They mount at any angle and come lubricated.

Optional output shafts are keyed and come with key stock.

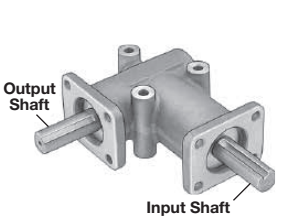
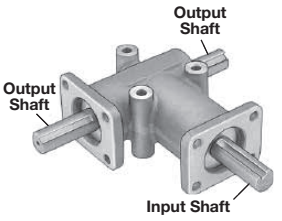
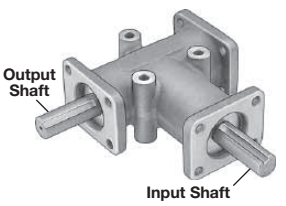
Extended-Life Right-Angle Gear Boxes and Speed Reducers



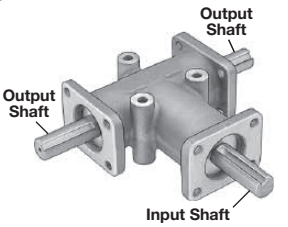
With Two Flanges and One Output Shaft



With Two Flanges and Two Output Shafts



With Three Flanges and One Output Shaft



With Three Flanges and Two Output Shafts

Spend less time on maintenance—these gear boxes and speed reducers have sealed ball bearings that don't require lubrication for a long service life. They accept clockwise or counterclockwise input rotation and transmit motion from your motor at a 90° angle. All have an aluminum enclosure. Keyed shafts do not include key stock. Use a coupling (not included) to connect to your motor. Mount at any angle.

High-Efficiency Speed Reducers

Designed to minimize torque loss between your motor and drive shaft, these speed reducers have spur gears that make them more efficient than our other speed reducers. Use these with a NEMA 56C motor to transmit motion parallel to the motor shaft while reducing speed and increasing torque. Speed reducers accept clockwise or counterclockwise input rotation. The output shaft rotates in the same direction as the input. The output shaft is solid (not keyed) with a through-hole. Enclosure is aluminum. Mount at any angle with the vent plug positioned above the shaft. Speed reducers require lubrication (sold separately).

Precision Speed Reducers for Position- and Speed-Control Motors

Pair these speed reducers with stepper and servo motors to reduce speed and increase torque in motion-control applications. They have helical planetary gears that provide exact positioning without additional motion (backlash) and smoother travel than our other speed reducers. They transmit motion parallel to the motor shaft. All accept clockwise or counterclockwise input rotation. The output shaft rotates in the same direction as the input. Enclosure is 416 stainless steel and aluminum and meets IP65 for protection from dust and spraying water. Mount at any angle. Speed reducers do not require lubrication.

NEMA 23 speed reducers have a D-profile output shaft.

NEMA 34 speed reducers have a keyed output shaft and come with key stock.

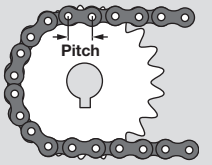
About Roller Chain and Sprockets



Roller chain links engage with matched sprocket teeth to transmit power between rotating shafts. Since there's no slippage and little stretch, chain drives can handle heavy loads and high torque.

Sizing Roller Chain and Sprockets—ANSI roller chain and sprockets have a standard ANSI number. Metric roller chain and sprockets have a standard ISO number. Only use chain and sprockets with the same number together.

If you don't know the ANSI or ISO number of your chain or sprocket, determine size by measuring pitch. Pitch is the distance between the pin centers of a chain link.

Modifying Roller Chain Length—Reduce chain length with a chain breaker (see page 1083). Join and extend chain with individual links.

Connecting links are also known as master links. They're used to join the ends of a chain length. The side plate is easy to remove for attaching to chain.

Adding links are also known as roller links. They require two connecting links to join chain.

Add-and-connect links are also known as half links and offset links. A combination of connecting and adding links, they join chain that requires an odd number of links. The side plate is easy to remove for attaching to chain.

Choosing a Sprocket Bore Style—Drive sprockets attach to rotating shafts and transmit power to your roller chain. They connect to the shaft with a bore; the bore style determines how they will attach.

- **Machinable-bore sprockets** have an unfinished bore that can be machined for a custom fit.
- **Finished-bore sprockets** fit directly on a shaft and attach with set screws and/or keyways that reduce slippage.
- **Bushing-bore sprockets** mate with a compatible bushing that attaches to the shaft. The same sprocket can be used with multiple shaft diameters.

ANSI Roller Chain and Links CAD

Run conveyors and power machinery with this general purpose steel roller chain. It comes with connecting links; one for 1- to 20-ft. lengths, five for 50-ft. lengths, and ten for 100-ft. lengths.

Heavy Duty—The links have thick side plates to handle double the working loads of standard chain.

Maintenance-Free ANSI Roller Chain and Links

Reduce downtime with this self-lubricating chain that doesn't need regular maintenance. It comes with connecting links; one for 1- to 19-ft. lengths, two for 20-ft. lengths, five for 50-ft. lengths, and ten for 100-ft. lengths.

Standard and **corrosion-resistant chain** has oil-impregnated bushings and oil-coated pins.

Extended-life chain has a rubber ring that seals grease between the bushings and pins and keeps dirt out.

Metric Roller Chain and Links

This chain conforms to ISO 606B and is compatible with BS 228 (British standard) and DIN 8187 (German standard). It comes with connecting links; one for 1- to 20-ft. lengths, five for 50-ft. lengths, and ten for 100-ft. lengths.

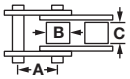
Plastic ANSI Roller Chain and Links

Standard

Extended Life

Extended-Life Connecting Link



Light, quiet, and corrosion resistant, this plastic chain is suitable for sound-sensitive and sanitary applications as well as wet conditions.

Standard—Links snap together, so you don't need connecting links.

Extended Life—Links have plastic bushings and inner side plates that are reinforced with 304 stainless steel pins and outer side plates for a longer service life than standard chain. Extended-life chain comes with connecting links; one for 1- to 20-ft. lengths, five for 50-ft. lengths, and ten for 100-ft. lengths.

Chain for food and beverage is USDA compliant and made from FDA-listed materials.

Chain for chemicals is made of PVDF for resistance to many harsh caustics and is commonly used in chemical manufacturing, paper pulping, and waste processing.

Double-Pitch ANSI Roller Chain and Links

With half as many rollers and links that are twice as long as other roller chain, this lightweight chain is designed for long drives and low- to moderate-speed applications. It can be used with standard sprockets with at least 24 teeth. Chain comes with connecting links; one for 1- to 20-ft. lengths, five for 50-ft. lengths, and ten for 100-ft. lengths.

Heavy Duty—The links have thick side plates to handle double the working loads of standard chain.

Hollow-Pin ANSI Roller Chain and Links

The hollow-pin-style bushings let you add attachments without disassembling this chain. It comes with connecting links; one for 1- to 19-ft. lengths, two for 20-ft. lengths, five for 50-ft. lengths, and ten for 100-ft. lengths.

Ultra-Flexible ANSI Roller Chain and Links

Also known as side bow chain, this chain has extra clearance between components for flexing from side to side on systems with curved tracks and sprockets that aren't exactly aligned. It comes with connecting links; one for 1- to 20-ft. lengths and five for 50-ft. lengths.

Connecting Link

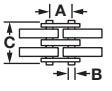
High-Strength Steel Leaf Chain

Also known as counterbalance chain, this chain is commonly used for low-speed pulling and as counterweight chain for machine tools, elevator and oven doors, and forklift masts. Made of interlaced steel plates held together by rivet pins, it has a higher tensile strength than roller chain and is used with flat pulleys instead of sprockets. Chain meets ASME B29.8M. When servicing worn leaf chain, replace the entire chain—do not splice chains together or mix old and new chain.

Clevis connectors attach your chain to a clevis.



ANSI No.	Pitch (A)	Pin Dia. (B)	O'all Wd. (C)	Lacing	Breaking Point, lbs.	Leaf Chain Lengths, ft.	Leaf Chain Per Ft.	Clevis Connectors Each

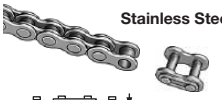
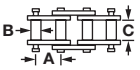
Miniature Roller Chain and Links





Half the size of our smallest ANSI chain, this chain fits on electronic equipment, instrumentation devices, printers, and other compact machinery. It's for use with our miniature sprockets (see page 1088).

Acetal chain is quiet, lightweight, and nonconductive. Links snap together, so you don't need connecting links.

300 series stainless steel chain stands up to highly corrosive conditions and can handle heavier working loads than acetal chain. It comes with connecting links; one for 1- to 20-ft. lengths, twenty for 50-ft. lengths, and forty for 100-ft. lengths.

Pitch (A)	Bushing Dia. (B)	Bushing Wd. (C)	Working Load, lbs.	Roller Chain Lengths, ft.		Roller Chain Per Ft.	Connecting Links Each	
Acetal								
0.1227″	0.06″	0.062″	2	1-10, 20, 50, 100	64225K72	$20.43	—	—

ANSI Roller Chain Attachment Links

Add these links to your roller chain for conveying, timing, and aligning. Mount brackets and guides on the attachment links or use them to move materials directly. Do not use with Maintenance-Free ANSI Roller Chain.

Tab-style links—Mount parts and hang hooks through the holes on the tabs.

Pin-style links—Trip switches with the extended pins.

Roller Chain Breakers

T-Handle

Wrench Drive

Breaker/Riveter

Customize chain lengths for a perfect fit on your drive. All chain breakers are steel.

T-handle breakers drive out chain pins with a twist of the handle.

Wrench-drive breakers remove chain pins without damaging side plates. Turn the clamping knob and tighten the hex-head screw with a wrench (not included) to push out the pin. A clamping sleeve helps to align the breaker to the pin.

Breaker/riveter can break ANSI numbers 50 and 60 roller chain. It also rivets ANSI number 50 chain to increase the strength of the side plates and pins for better performance on high-speed drives. Attach the removable handle and clamp the breaker/riveter in a vise or bolt it to a workbench with two 3/8"-24 bolts (not included). It comes with a steel rivet set, a rivet anvil, and a press plate.

For ANSI Chain Nos.	Pitch	Chain Breakers		Replacement Points

80-240	18"	1 1/2"	2370K3	279.47

Roller Chain Spring-Clip Removers

Quick-Twist Tool

Pliers

Give your hands a break with these tools that easily remove spring clips from links.

Quick-Twist Tool—Twist this steel tool on the clip to remove it.

Pliers—The notched jaws push the clip off the link.

Quick-Twist Tool	2372K1	$3.40
Pliers	1064N11	32.98

Roller Chain Holders

Jaw Style

Cable Style

Keep roller chain in place while you add or remove links. These roller chain holders are steel.

Jaw-style holders hook into your roller chain and have a handle that tightens the jaws until the chain ends are close enough to add or remove a link.

Cable-style holder has hooks at each end of the cable that insert onto the rollers beyond the links you want to change. Tighten the hooks with the included box wrench to add or remove a link, and pull the lever handle to release the cable. Minimum roller width is 5/8".

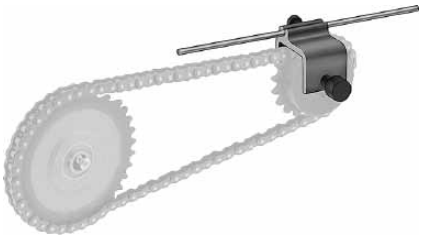
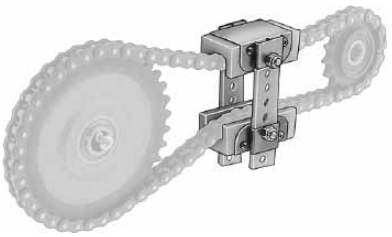
Roller Chain Alignment Tools



Align sprockets and roller chain during installation and adjustment. Clamp this aluminum tool to your sprocket, and the alignment rod indicates when the sprocket lines up with the chain.

Max. Sprocket Wd.		
1"	1065N11	$24.73

Extended-Life Adjustable Roller Chain Tensioners



Increase the life of your roller chain with these tensioners that engage with the side plates instead of the rollers. Riding on your chain drive, they have adjustable straps that take up slack and apply constant tension. These tensioners are polyethylene with a stainless steel housing, and materials are USDA compliant and FDA listed. Maximum temperature is 200° F. Tension force is not rated.

For ANSI Chain Nos.	Lg.	Wd.

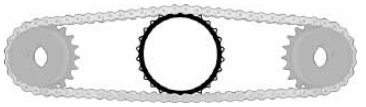
Maintenance-Free Self-Adjusting Roller Chain Tensioners



Reduce chain wear and noise without worrying about adjustment—these plastic rings install between strands of roller chain and absorb slack in your system without needing alignment, lubrication, or tools. They're often used on chain drives in confined spaces where maintenance is difficult. Maximum temperature is 158° F.

For ANSI Chain No.	Max. Speed, ft./min.	No. of Teeth on Drive Sprocket	OD	Tension Force, lbs.

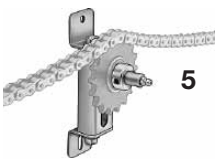
Adjustable Roller Chain and Belt Tensioners

1

2

3

4



5

Take up slack and adjust the tension on your roller chain or belt. These tensioners are for use with idler sprockets (see 6663K on page 1086) or pulleys (see 59475K, 6234K, and 6235K on page 1102).

Tensioners with Adjustment Arm—Position the adjustment arm to control tension at any point in a 360° arc. These tensioners are cast iron. Tension force is 45 lbs.

Tensioners with Spring-Loaded Adjustment Arm—A built-in spring allows the adjustment arm to apply continuous tension and automatically take up slack. The arm moves in a 180° arc. These tensioners are cast iron. Tension force is 45 lbs.

Tensioners with Adjustment Screw—Precisely apply tension in a straight line by moving the adjustment screw. These tensioners are steel. Tension force is not rated.

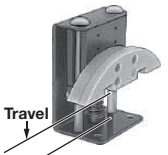
Self-Adjusting Spring-Loaded Roller Chain Tensioners

Standard



Low Profile

Ultra Low Profile

Built-in springs put constant tension on roller chain to absorb and buffer shock, reduce vibration, and improve drive performance. All tensioners can be mounted horizontally or vertically. They have a polyethylene arc.

Standard tensioners have an aluminum housing and mount with one bolt (not included); use a 3/8″ bolt on tensioners for ANSI numbers 35 and 40 chain, a 7/16″ bolt on tensioners for ANSI numbers 50 and 60 chain, and a 1/2″ bolt on tensioners for ANSI numbers 80 and 100 chain. Maximum temperature is 180° F.

Low-profile tensioners are nearly half the height of standard tensioners for use on low-clearance drives. They have a steel housing and mount with two M6 screws (not included). Maximum temperature is 140° F.

Ultra low-profile tensioners are less than 3″ tall, so they fit in extremely tight spots. They have a stainless steel housing and mount with two M5 screws (not included). Maximum temperature is 140° F.

Roller Chain Guides

Open Channel

Center Channel

Deep Channel

Minimize friction, reduce noise, and prolong the life of your roller chain with these polyethylene guides. They can be cut to the exact length you need. Maximum temperature is 176° F.

To Order: Please specify 1-ft. to 8-ft. lengths.

Center-channel guides align chain more precisely than open-channel guides.

Deep-channel guides prevent chain from slipping off track. Also known as captured guides, they have a metal frame that can be welded or bolted into position.

Style 6 have a flanged frame for easy mounting. Holes are every 12″ and fit 5/16″ bolts; fasteners are not included. Choose a 304 stainless steel frame for better corrosion resistance than steel.

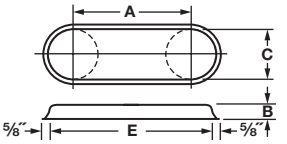
Made-to-Order Guards

To Order: Please specify the following dimensions:

Actual sprocket center-to-center distance (A); guard depth, which is the max. sprocket width (B) plus 1″; large sprocket OD (C); small sprocket OD (D); and clearance between sprocket and side of guard (F). Recommended clearance is 2″.

Sprocket Center-to-Center Distance		
0″ to 12″	6248K61	$230.00
12.1″ to 22″	6248K62	280.00
22.1″ to 32″	6248K63	350.00
32.1″ to 48″	6248K64	418.18

Corrosion-Resistant Guards for Chain and Belt Drives



These plastic guards won't rust, and they absorb impact from chain and belt drives. Drill holes for mounting and venting. All guards have a backplate and a flange to accommodate mounting holes up to 1/4″ dia. Maximum temperature is 200° F. Use your sprocket dimensions to determine the guard size you need.

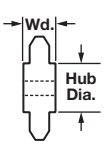
Idler Sprockets for ANSI Roller Chain

Low-Profile Hub

With Ball Bearings

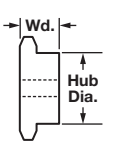
With Bronze Sleeve Bearings



Wide Hub

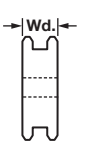
With Bronze Sleeve Bearings

With Needle Bearings



Hubless

With Ball Bearings



Maintain constant tension on your drive with these sprockets that press against your chain to take up slack and reduce wear and vibration. They rotate freely on built-in bearings and are for use with roller chain tensioners (sold separately on page 1084). *Ball bearings* are double sealed to keep dirt out. *Bronze sleeve bearings* are self-lubricating. *Needle bearings* minimize internal friction.

Low-Profile Hub—Use these sprockets in narrow spaces.

Wide Hub—These sprockets offer the stability needed to handle heavy loads.

Hubless—With no hub, these sprockets fit double-strand roller chain drives with little clearance.

Nylon sprockets are lightweight, quiet, and corrosion resistant.

Steel sprockets are more durable than nylon sprockets. *Sprockets with hardened teeth* have increased wear resistance for a long service life.

Machinable-Bore Double-Strand Sprockets for ANSI Roller Chain

Use these steel sprockets with ANSI double-strand chain. They are furnished with the minimum bore size listed and can be machined to the maximum bore size listed. These sprockets have hardened teeth for increased wear resistance and a long service life.

Machinable-Bore Sprockets for ANSI Roller Chain

For a custom fit on your shaft, these sprockets can be machined to your exact specifications. They are furnished with the minimum bore size listed and can be machined to the maximum bore size listed.

Nylon sprockets are lightweight, quiet, corrosion resistant, and easier to machine than metal sprockets.

Steel and **18-8 stainless steel sprockets** are more durable than nylon sprockets. *18-8 stainless steel sprockets* are corrosion resistant for use in harsh environments.

Machinable-Bore Flat Sprockets for ANSI Roller Chain

Also known as A-plate sprockets, these steel sprockets have a slim profile that fits in narrow spaces. They are furnished with the minimum bore size listed and can be machined to the maximum bore size listed.

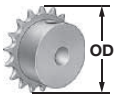
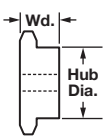
Finished-Bore Sprockets for Miniature Roller Chain



303 Stainless Steel



Often used in electronic equipment and instrumentation devices, these sprockets fit chain drives too small for ANSI sprockets. They are for use with our miniature roller chain and links (see page 1082).

Acetal sprockets are lightweight, quiet, and nonconductive. They press onto your shaft.

303 stainless steel sprockets are corrosion resistant for use in harsh environments. They have one set screw.

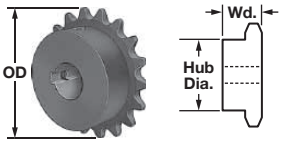
Finished-Bore Sprockets for ANSI Roller Chain

No machining necessary—these steel sprockets are ready for mounting on your shaft. They have two set screws and a standard ANSI keyway, except 1/4", 3/8", and 1/2" bore sizes do not have a keyway.

Sprockets with hardened teeth have increased wear resistance for a long service life.



To Order: Please specify standard or hardened teeth and bore size: 1/4", 3/8", 1/2", 5/8", 3/4", 7/8", 1", 1 1/8", 1 3/16", 1 1/4", 1 3/8", 1 7/16", 1 1/2", or 1 5/8".

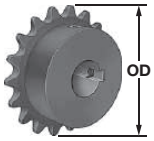
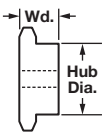
(Continued on following page)

Finished-Bore Sprockets for ANSI Roller Chain *(Continued from previous page)*





No machining necessary—these steel sprockets are ready for mounting on your shaft. They have two set screws and a standard ANSI keyway, except 1/4", 3/8", and 1/2" bore sizes do not have a keyway.
Sprockets with hardened teeth have increased wear resistance for a long service life.

To Order: Please specify standard or hardened teeth and bore size: 5/8", 3/4", 7/8", 1", 1 1/8", 1 3/16", 1 1/4", 1 3/8", 1 7/16", 1 1/2", 1 5/8", 1 3/4", 1 15/16", 2", 2 3/16", 2 7/16", or 2 15/16".

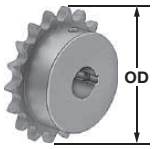
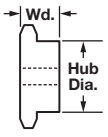
Corrosion-Resistant Finished-Bore Sprockets for ANSI Roller Chain





These 18-8 stainless steel sprockets withstand washdown conditions and harsh environments. They have two set screws and a standard ANSI keyway.

To Order: Please specify bore size: 3/8", 1/2", 5/8", 3/4", 7/8", 1", 1 1/8", 1 3/16", 1 1/4", or 1 1/2".

Quick-Disconnect (QD) Bushing-Bore Sprockets for ANSI Roller Chain

Change bore size without replacing your sprocket. Convenient for use with multiple shaft diameters, these steel sprockets mate with compatible QD bushings (sold separately on page 1092) that can be swapped out for a different bore size.

Taper-Lock Bushing-Bore Sprockets for ANSI Roller Chain

Get the same sizing versatility as quick-disconnect (QD) sprockets while using less space. The bushings for these sprockets mount flush inside the sprocket hub for a slim profile. The same sprocket can be used with different shaft diameters; choose a compatible taper-lock bushing (sold separately on page 1092) with the bore size you need.

Split-Tapered Bushing-Bore Sprockets for ANSI Roller Chain

Since these steel sprockets grip bushings more tightly than taper-lock sprockets, they're often used in high-torque applications. The same sprocket can be used with different shaft diameters; choose a compatible split-tapered bushing (sold separately on page 1092) with the bore size you need. P1- and Q1-compatible sprockets have a keyway that fits a matching key on the bushing.

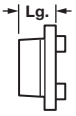
Quick-Disconnect (QD) Bushings



Use these bushings to make the same sprocket or pulley compatible with multiple shaft diameters. They fit quick-disconnect (QD) sprockets (sold separately on page 1091) and pulleys (see page 1105) of the same bushing style. As you tighten the included cap screws, the bushing grips the shaft and pulls it into the sprocket or pulley. Bushings are steel or cast iron.

To Order: Please specify bore size. Depending on the bore size you choose, the bushing will have the corresponding keyway listed below. Bushings with a standard ANSI or ISO keyway do not come with a key. Bushings with a shallow keyway come with a key.

Inch

Bushing Style	Lg.	Cap Screw Torque, in.-lbs.	Choose a Bore Size: Standard ANSI Keyway	Shallow Keyway	No Keyway

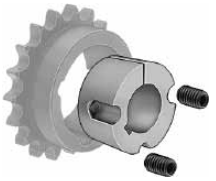
Taper-Lock Bushings



Mount these hubless bushings flush into your sprocket or pulley for a slim profile with no protruding screws. These steel bushings are for use with taper-lock sprockets (sold separately on page 1091) of the same bushing style. As you tighten the included set screws, the bushing grips the shaft and pulls it into your sprocket or pulley. Bushings have an 8° taper.

To Order: Please specify bore size; bushings have either a standard ANSI keyway or a shallow keyway. Bushings with a standard ANSI keyway do not come with a key. Bushings with a shallow keyway come with a key.

Bushing Style	Choose a Bore Size: Standard ANSI Keyway	Shallow Keyway	Lg.	Set Screw Torque, in.-lbs.

Split-Tapered Bushings

The tapered barrel on these steel bushings is split on both sides, allowing them to contract more tightly around the shaft than quick-disconnect (QD) and taper-lock bushings. They're for use with split-tapered sprockets (sold separately on page 1091) and pulleys (see page 1103) of the same bushing style. As you tighten the included cap screws, the bushing grips the shaft and pulls it into the sprocket or pulley. Bushings have a 3° taper. All bushings have a standard ANSI keyway. P1, P2, and Q1 bushing styles also come with a key that fits a matching keyway on the sprocket or pulley for high-torque applications.

To Order: Please specify bore size: 3/8", 1/2", 5/8", 3/4", 7/8", 1", 1 1/8", 1 3/16", 1 1/4", 1 3/8", 1 7/16", 1 1/2", 1 5/8", 1 3/4", 1 7/8", or 2".

Bushing Style	Choose a Bore Size	Lg.	Cap Screw Torque, in.-lbs.		
G	3/8"-1"	1"	95	9859T1	$9.50

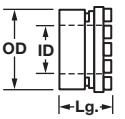
Q1	3/4"-2"	2 1/2"	348	9859T5	62.47

Heavy Duty Screw-Clamp Bushings

Self Centering

Flush Mount



Handle shock loads and high torque with these high-capacity keyless bushings. When you tighten the included cap screws, the bushing's inner sleeve contracts onto the shaft and the outer sleeve expands to hold your sprocket, pulley, or gear. These steel bushings can be mounted on shafts with or without keyways. Match the bushing ID to your shaft diameter and the bushing OD to the bore size of your sprocket, pulley, or gear.

Self-centering bushings have a mounting flange that prevents movement during tightening, so it's easy to center the bushing in the bore.

Flush-mount bushings have no flange, so they can be inserted into the bore for flush or recessed mounting. They have higher torque ratings than self-centering bushings.

Quick-Grip Screw-Clamp Bushings

Tighten these bushings with a twist of the collar nut—no keys or cap screws needed. They're also known as Trantorque bushings. As you tighten the collar nut, the inner sleeve contracts onto the shaft and the outer sleeve expands to hold your sprocket, pulley, or gear. Match the bushing ID to your shaft diameter; match the bushing OD to the bore of your sprocket, pulley, or gear.

304 stainless steel bushings are corrosion resistant for use in harsh environments.

Self-Adjusting Spring Bushings

A toothed slot lets these bushings contract for insertion into the bore of your sprocket or pulley and then expand for a snug fit. Made of spring steel, they flex under stress and shock and can handle oscillating or slow rotational motion.

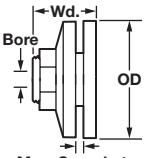
Friction Torque Limiters and Sprockets

Prevent overload from damaging your equipment with these torque limiters installed on your sprocket or pulley. When overloaded, the limiters cause your sprocket or pulley to slip. Once the overload is eliminated, the limiters automatically reset. They have a steel hub and pressure plate, 1/8" thick friction discs between the hub and pressure plate, and a set screw. Torque limiters with a 2 1/4" OD and a 3/4" bore size have a 3/64" (shallow) keyway; all other limiters have a standard ANSI keyway.

Double-Spring Torque Limiters—These have a second spring for handling nearly twice the torque of single-spring limiters.

Optional Roller Chain Sprockets—Designed specifically to fit the corresponding limiters in the table, these hubless sprockets are not interchangeable.



Max. Sprocket or Pulley Thickness (A)

Torque Limiter Shown with Optional Sprocket

To Order: For limiters, please specify bore size: 1/4", 5/16", 3/8", 1/2", 5/8", 3/4", 7/8", 1", 1 1/8", 1 3/16", 1 1/4", 1 3/8", 1 7/16", 1 1/2", or 1 5/8".
For sprockets, please specify ANSI chain number: 25, 35, 40, 41, 50, 60, 80, or 100.

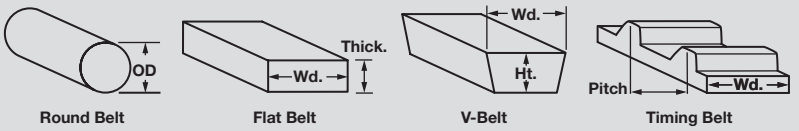
About Sizing Belts

Replacing a Belt—V-belts and timing belts are marked with a trade size for easy reordering. If your belt does not have a trade size, use the belt's measurements to find a replacement.

1. Measure the dimensions of your existing belt.

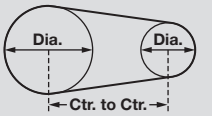


Round Belt | Flat Belt | V-Belt | Timing Belt

2. Wrap a string around the existing belt to measure the outer circle.
3. Round the outer circle down to nearest whole number to account for belt stretch.

Sizing a New Belt—Follow these steps to estimate belt outer circle for a new system.

1. Add the diameters of your pulleys.
2. Multiply the sum of Step 1 by 1.6.
3. Multiply the Ctr.-to-Ctr. by 2.
4. Add Steps 2 and 3.



Round Belting

Quick-Connect Hollow-Core Belting

Solid-Core Belting with Textured Surface

Heavy Duty Solid-Core Belting

Run this chemical- and abrasion-resistant urethane belting in light duty conveying and power-transmission applications. Inch sizes are made from FDA-listed material for use with food and beverage.

Belting with a smooth surface is easy to clean. *Belting with a textured surface* grips material better than belting with a smooth surface.

Quick-Connect Hollow-Core Belting—Join the ends with the hollow-core round belting connectors sold separately on this page.

Solid-Core Belting—Choose this belting for stronger connections than quick-connect hollow-core belting. Join the ends of this belting with the solid-core round belting connectors sold separately on this page or use a welding kit (see 62065K41 on page 1113). **Heavy duty solid-core belting** is reinforced with a polyester cord for increased strength.

Solid-Core Round Belting Connectors

Join solid-core round belting by trimming belting ends to a point and twisting them into the threaded ends of these steel connectors. They have a joint to accommodate turns. These connectors are for use with urethane, rubber, and leather round belting.

For Belt OD		
3/16"	6180K12	$20.78

Extended-Life Leather Round Belting

Belting

Connector

More elastic than urethane, this leather belting resists permanent stretch for a long service life. Color is tan. Join belting ends with steel connectors (sold separately).

Joining tool cuts belting, punches holes for connectors, and secures connectors to belting ends.

Joining Tool			1848K1	79.41

Ultra-Flexible Round Belting

Coiled-spring construction provides the flexibility to bend around small-diameter pulleys and accommodate curved belt drives and misaligned pulleys. Cut belting to the length you need, thread connectors (sold separately) onto each end, and hook them together. Belting comes in 10-ft. lengths.

Standard belting is steel.

Corrosion-resistant belting is 302 stainless steel for use in harsh environments.

Quick-Hook Twisted Round Belts

Install these urethane belts without dismantling your drive shafts—hook the ends together with the attached stainless steel connector. *Optional plastic C-hook* can be used instead of the stainless steel connector.

Installer kit includes a stainless steel holding tool to keep one end of the belt in place, a gripping retriever to loop the belt around your pulley, and a hooked tool for pulling the belt loop over the connector.

To Order: Please specify outer circle (OC) in 1/4" increments.

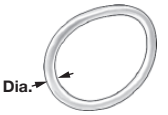
Round Belts

Also known as O-ring and endless belts, these come ready to use.

Urethane—All urethane belts are chemical and abrasion resistant. **Standard urethane belts** are made from FDA-listed material for use with food and beverage. **High-performance urethane belts** are more chemical and abrasion resistant than other urethane belts. *Inch sizes* are made from FDA-listed material for use with food and beverage. *Metric sizes* have a textured surface for a strong grip on material. **Heavy duty urethane belts** are reinforced with a polyester cord for strength.

Neoprene Rubber—These belts are more flexible than urethane belts.



To Order: For all belts, please specify outer circle (OC) in 1/4" increments.

Standard Urethane Belts—Clear

Flat Belting

Resistant to chemicals and abrasion, this urethane flat belting is often used for light to medium duty power transmission. It is made from FDA-listed material for use with food and beverage. Color is orange. To join ends, use a welding kit (see 62065K41 on page 1113).

Super-Grip Rubber Flat Belting

3 Ply

Commonly used for material handling and light to medium duty power transmission, this belting has a textured rubber cover on both sides for a better grip on material than urethane. Inner layers are cotton. Width tolerance is ±1/8". Color is tan. To join ends, use alligator belt lacing (see page 1113).

Three-ply min. pulley dia. is 2 1/2". **Four-ply** min. pulley dia. is 3". **Five-ply** min. pulley dia. is 3 1/2".

Extended-Life Leather Flat Belting

1 Ply

2 Ply

High Speed

Since this leather belting resists permanent stretch and has excellent resistance to oil, it lasts longer than urethane and rubber belting. To join ends, use alligator belt lacing (see page 1113).

Light duty belting is also known as side-stock belting. Color is tan. Choose two-ply belting for additional strength.

Heavy duty belting is also known as center-stock belting. It's stronger than light duty belting. Color is tan. Choose two-ply belting for additional strength.

High-speed belting is three-ply with a nylon core for handling higher speeds than other leather flat belting. Color is gray.

V-Belting

Create custom V-belt sizes with this urethane V-belting. It's made from FDA-listed material for use with food and beverage and is chemical and abrasion resistant. This belting is commonly used for light to medium duty power transmission and conveying. To join ends, use a welding kit (see 62065K41 on page 1113).

Profile-Top V-Belting—Specially shaped tops carry materials in conveying applications.

V-Belts for Variable-Speed Pulleys

A wide profile allows these belts to ride up and down the groove in variable-speed pulleys to handle a wide range of speed ratios. Notches increase flexibility for bending around small-diameter pulleys. Belts are neoprene with polyester reinforcing cords. Color is black.

Adjustable-Length V-Belting

Quickly increase or reduce belt length. This belting is often used to make replacement V-belts.

Screw Connect—Cut this perforated belting to length and screw the steel connectors (sold separately below) into the holes. Color is green.

Link Connect—Add or remove links to change belt length without dismantling your drive.

Twist-lock belting has tabbed links that twist together to form a belt. Color is red.

Static-control twist-lock belting limits static electricity discharge for hazardous applications such as fuel transfer and solar-cell manufacturing. Color is blue.

Grip-top twist-lock belting has a textured PVC top layer for conveying material in slippery environments or up steep inclines. Belt type A is purple and green. Belt types B and C are red and green.

Press-lock belting has links with steel rivets that press together; use the installation tool (sold separately below) to easily add and remove links. Color is orange.

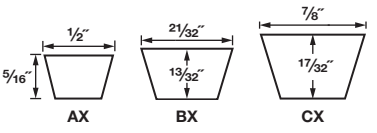
AX-, BX-, and CX-Section Cogged V-Belts



More flexible than smooth V-belts, these have notches that allow them to bend around small-diameter pulleys and accommodate twists and turns on curved drives. They dissipate more heat than A-, B-, and C-section belts for a long service life. These belts are rubber with polyester reinforcing cords. Color is black.

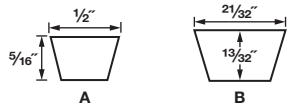
A- and B-Section Precision-Matched V-Belts



Ensure even load distribution on drives with multiple belts. These are matched to the trade size within a tight tolerance for better performance and reduced wear compared to standard A- and B-section V-belts. They are rubber with polyester reinforcing cords. Color is black.

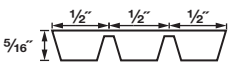
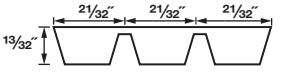
Banded A- and B-Section V-Belts

Also known as serpentine belts, these have multiple bands that function as a single unit for consistent drive performance and even load distribution. They handle shock loads better than individual belts. These belts are rubber with polyester reinforcing cords. Color is black.



3-Band A



3-Band B

3-Band Belt

To Order: Please specify number of bands: 2, 3, 4, or 5.

High-Capacity Narrow-Wedge 3V-, 3VX-, 5V-, and 5VX-Section V-Belts

A narrow belt profile transmits up to three times the horsepower of A-, B-, and C-section V-belts for use on heavy duty drives with shock loads. These belts are rubber with polyester reinforcing cords. Color is black.

Cogged 3VX and **5VX belts** have notches that increase flexibility for bending around small-diameter pulleys and dissipate heat for a long service life.

3V and 5V

Cogged 3VX and 5VX

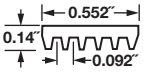
Ultra-Flexible J-Section V-Belts



6-Band Belt

An extremely thin profile gives these belts the flexibility to bend around small-diameter pulleys. They are banded to provide extra surface contact for handling high speed ratios. Belts are rubber with polyester reinforcing cords. Color is black.

Outer Circle	4 Bands—0.368″ Wd. Trade Size			6 Bands—0.552″ Wd. Trade Size			8 Bands—0.736″ Wd. Trade Size			10 Bands—0.920″ Wd. Trade Size

SPZ-, XPZ-, and XPA-Section Metric V-Belts

SPZ

Use these V-belts with metric pulleys. They are rubber with polyester reinforcing cords. Color is black.
Cogged XPZ- and **XPA-section belts** have notches that increase flexibility for bending around small-diameter pulleys and dissipate heat for a long service life.

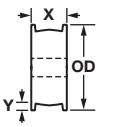
Flat-Belt Idler Pulleys

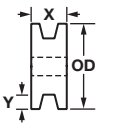
Nylon

Steel and Cast Iron



V-Belt Idler Pulleys

Nylon



Take up slack and reduce wear and vibration on your drive with these pulleys that maintain constant tension on your belt. Often used with belt tensioners (sold separately on page 1084), they rotate freely on built-in bearings. *Ball bearings* are double sealed to keep dirt out. *Needle bearings* minimize internal friction.

Nylon pulleys are lightweight and corrosion and abrasion resistant.
Miniature brass pulleys are less than a ½″ wide, so they fit in extremely small spaces. They are nonsparking.
Steel and **cast iron pulleys** are more durable than nylon pulleys.

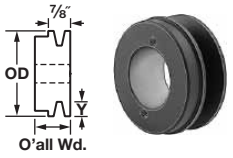
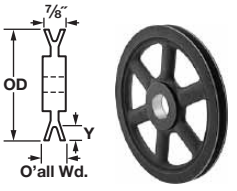
Split-Tapered Bushing-Bore V-Belt Pulleys



3.15″ to 6.25″ OD



6.75″ to 18.75″ OD

These cast iron pulleys have the same sizing versatility as quick-disconnect (QD) pulleys, but they get a tighter grip on bushings for use in high-torque applications. The same pulley can be used with different shaft diameters; choose a Style H split-tapered bushing (see 6086K19 on page 1092) with the bore size you need. They are for use with A-section (4L and A) and B-section (5L and B) V-belts. *3.15″ to 6.25″ OD pulleys* have a solid body. *6.75″ to 18.75″ OD pulleys* have a spoked body.

Flat-Belt Pulleys

Also known as paper-plant pulleys, these are made of a paper-fiber composite that minimizes slippage and wear. They have two set screws and a standard ANSI keyway, except pulleys for 1" and 1 1/2″ belts have one set screw.

Adjustable-Pitch V-Belt Pulleys

Increase efficiency, vary speed, and extend the life of your drive by changing the pitch on these cast iron pulleys. Turn the sides of the pulley on the threaded hub to increase or decrease the pitch. These pulleys are for use with 3L-section, A-section (4L, A, and AX), and B-section (5L, B, and BX) V-belts, unless otherwise stated. They have one set screw, except 3.75″ OD pulley with 1″ bore size has two set screws. Pulleys have a standard ANSI keyway, except 1/2″ bore size does not have a keyway.

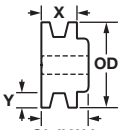
V-Belt Pulleys for A- and B-Section V-Belts

Standard

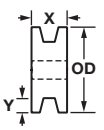
Zinc
1.5″ to 5″ OD

Zinc
5.5″ to 10″ OD



O'all Wd.

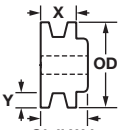
Plastic



Heavy Duty

Cast Iron
2″ to 4.45″ OD

Cast Iron
4.75″ to 13.75″ OD



O'all Wd.

Standard—Zinc pulleys have one set screw and a standard ANSI keyway, except ⅜″ and ½″ bore sizes do not have a keyway. *1.5″ to 5″ OD pulleys* have a solid body, unless noted. *5.5″ to 10″ OD pulleys* have a spoked body. **Plastic** pulleys are made from FDA-listed material for use with food and beverage. Body is solid.

Heavy Duty—These pulleys have one set screw and a standard ANSI keyway, except ½″ bore size does not have a keyway. *2″ to 4.45″ OD pulleys* have a solid body. *4.75″ to 13.75″ OD pulleys* have a spoked body.

Standard

To Order: Please specify bore size: ¼″, ⅜″, ½″, ⅝″, ¾″, or 1″.

Quick-Disconnect (QD) Bushing-Bore V-Belt Pulleys

Use the same pulley on multiple shaft diameters. These pulleys mate with compatible quick-disconnect (QD) bushings (sold separately on page 1092) that can be swapped out for a different bore size. They have a solid body, unless noted. Pulleys are cast iron, except 3.75″ to 6.95″ OD pulleys for A-section and B-section V-belts are steel.

For 3V-Section (3V and Cogged 3VX) V-Belts—Please specify 1 or 2 grooves; OD from 3.35″ to 5″; and JA or SH bushing style **9615K85**

For 5V-Section (5V and Cogged 5VX) V-Belts—Pulleys have two grooves and are SK bushing style. Please specify OD from 7.10″ to 9″ **9615K86**

For J Section V-Belts—Please specify 6, 10, or 16 grooves; OD from 2.5″ to 8″; and JA, SH, or SK bushing style **1405K56**

★ Body is spooled.

Adjustable-Speed V-Belt Pulleys

Also known as step-cone pulleys, these have multiple groove sizes so you can quickly change rotation speed by moving your belt to a different groove. They are commonly used on drives with frequent speed changes. Use these zinc pulleys with A-section (4L and A) V-belts with fractional-horsepower motors. They have one set screw and a standard ANSI keyway, except ½″ bore size does not have a keyway.

Cut-to-Length Timing Belts and End Plates

Use these belts in your linear motion drive system. Belts have trapezoidal teeth.

Multipurpose belts combine quiet-running neoprene with high-strength fiberglass reinforcement. The teeth are nylon coated to protect the wear surface and minimize friction. Temperature range is –30° to 180° F. Color is black.

Dust-free belts are abrasion-resistant urethane, so they won't create dust while they run. They have Kevlar reinforcement and a temperature range of –22° to 230° F, except AT10 series belts have steel reinforcement and a temperature range of 32° to 176° F. Color is white.

End plates (sold separately) allow you to secure belt ends to a flat surface. They are aluminum and have eight 6.5 mm mounting holes, except plates for XL series belts have 5.5 mm holes.

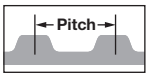
MXL Series Timing Belts and Pulleys

Belt



Aluminum Pulley with One Flange

Aluminum Pulley with Two Flanges

These MXL series (miniature extra light) timing belts and pulleys have trapezoidal teeth with a 0.080″ pitch.

Belts are black and have a temperature range of –30° to 180° F. *Multipurpose* belts are quiet-running neoprene reinforced with high-strength fiberglass. Belt teeth are nylon coated to protect the wear surface and minimize friction. *Dust-free* belts are abrasion-resistant urethane, so belts don't create dust while they run. They have Kevlar reinforcement, which has very high strength, low stretch, and excellent shock resistance.

Pulleys have a finished bore. *Aluminum* pulleys have good corrosion resistance. They include a set screw to grip the shaft. *Polycarbonate* pulleys are lightweight.

For information about sizing belts, see page 1094.

T5 Series Dust-Free Timing Belts and Pulleys

These timing belts and pulleys have trapezoidal teeth with a 5 mm pitch.

Belts are abrasion-resistant urethane, so they don't create dust while they run. They have steel reinforcement for very high strength, low stretch, and excellent shock resistance. Temperature range is –13° to 176° F. Color is gray.

Pulleys are aluminum for good corrosion resistance. They have a plain bore that press-fits to a shaft.

Timing Belts with Teeth on Both Sides

Often used in reversing and serpentine drive systems, teeth on both sides allow you to rotate pulleys in opposite directions. Belts combine quiet-running neoprene with high-strength fiberglass reinforcement. The teeth are nylon coated to protect the wear surface and minimize friction. Temperature range is –30° to 180° F. Color is black.

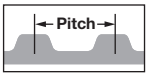
L Series Timing Belts and Pulleys

Belt



Press-Fit Pulley

Quick-Disconnect Pulley

L series (light) timing belts and pulleys have trapezoidal teeth with a 0.375″ pitch.

Multipurpose belts combine quiet-running neoprene with high-strength fiberglass reinforcement. Teeth are nylon coated to protect the wear surface and minimize friction. Color is black.

Dust-free belts are abrasion-resistant urethane, so they don't create dust while they run. Choose from steel and Kevlar reinforcement. Both provide very high strength, low stretch, and excellent shock resistance. Kevlar is more shock resistant than steel. Belts with steel reinforcement are gray; belts with Kevlar are black.

Heat-resistant belts are silicone, which withstands temperatures up to 400° F. They have Kevlar reinforcement for high strength, low stretch, and excellent shock resistance. Color is white.

Press-fit steel pulleys have two flanges. Pulleys with 10 to 16 teeth have a finished bore that includes set screws to grip the shaft, and pulleys with 18 to 24 teeth have a plain bore.

Press-fit aluminum pulleys are more corrosion resistant than steel pulleys. They have two flanges and a finished bore with set screws to grip the shaft.

Quick-disconnect pulleys mount with a quick-disconnect (QD) bushing (sold separately, see page 1092) for a more secure grip on the shaft than set screws. Pulleys are steel and have two flanges, unless noted.

■ Made of iron; not flanged.

H Series Timing Belts and Pulleys

H series (heavy) timing belts and pulleys have trapezoidal teeth with a 0.500″ pitch.

Multipurpose belts are quiet-running neoprene with high-strength fiberglass reinforcement. The teeth are nylon coated to protect the wear surface and minimize friction. Color is black.

Dust-free belts are abrasion-resistant urethane, so belts don't create dust while they run. Belts have steel reinforcement for high strength, low stretch, and excellent shock resistance. Color is gray.

Heat-resistant belts endure temperatures up to 400° F. They are silicone and have Kevlar reinforcement, which has very high strength, low stretch, and excellent shock resistance. Color is white.

Press-fit pulleys are steel with two flanges. All have a plain bore.

Quick-disconnect pulleys mount with a quick-disconnect (QD) bushing (sold separately, see page 1092) for a more secure grip on the shaft than set screws. They are steel and have two flanges, unless noted. Pulleys for 1″ max. belt width are 1.313″ wide. Pulleys for 1½″ max. belt width are 1.813″ wide. Pulleys for 2″ max. belt width are 2.344″ wide.

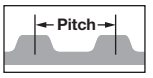
XL Series Timing Belts and Pulleys

Belt



Pulley with Two Flanges

XL series (extra light) timing belts and pulleys have trapezoidal teeth with a 0.200″ pitch.

Multipurpose belts combine quiet-running neoprene with high-strength fiberglass reinforcement. Teeth are nylon coated to protect the wear surface and minimize friction. Color is black.

Dust-free belts are abrasion-resistant urethane. Choose from steel and Kevlar reinforcement, which both provide very high strength, low stretch, and excellent shock resistance. Kevlar is more shock resistant than steel. *Belts with steel reinforcement* are gray. *Belts with Kevlar reinforcement* are black.

Heat-resistant belts are silicone, which resists temperatures up to 400° F. They have Kevlar reinforcement for high strength, low stretch, and excellent shock resistance. Color is white.

Pulleys have a finished bore with set screws to grip the shaft. *Acetal* pulleys are a lightweight alternative to steel. They have an aluminum hub. *Aluminum* pulleys are more corrosion resistant than steel pulleys.

High-Strength HTD Timing Belts and Pulleys

These HTD (high torque drive) timing belts and pulleys have a curved tooth shape that provides higher strength than trapezoidal teeth.

Belts are neoprene with fiberglass reinforcement for quiet operation. The teeth are nylon coated to protect the wear surface and minimize friction. Color is black. *5 mm pitch* belts are interchangeable with Gates PowerGrip GT and Carlisle RPP belts. Temperature range is -40° to 180° F. *8 mm pitch* belts are interchangeable with Gates PowerGrip GT3 belts. Temperature range is -30° to 180° F.

Stainless steel pulleys are more corrosion resistant than zinc-plated steel pulleys.

Press-fit pulleys come machined to the for shaft dia. size. *Zinc-plated steel* pulleys are machinable up to the for max. shaft dia. size.

Quick-disconnect pulleys mount with a quick-disconnect (QD) bushing (sold separately, see page 1092) for a more secure grip on the shaft than set screws.

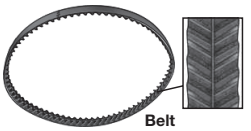
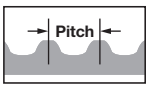
High-Strength Ultra-Quiet Timing Belts and Pulleys





Press-Fit Pulley

Quick-Disconnect Pulley

The teeth of these timing belts and pulleys are curved and set in an offset pattern for high strength and 25% less operating noise than belts with trapezoidal teeth. Pitch is 8 mm.

Belts are Buna-N with Kevlar reinforcement, which has very high strength, low stretch, and excellent shock resistance. Temperature range is –60° to 200° F. Color is black.

Pulleys are iron with a manganese phosphate finish. *Press-fit* pulleys come machined to the smallest for shaft dia. size and are machinable up to the largest size listed. *Quick-disconnect* pulleys mount with a quick-disconnect (QD) bushing (not included, see page 1092) to grip the shaft more securely than pulleys that press fit.

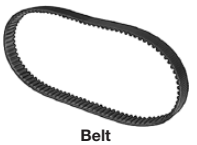
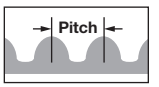
Ultra-High-Strength Poly Chain Timing Belts and Pulleys



Belt



Taper-Lock Pulley

Strong enough to replace roller chain, these belts and pulleys have curved teeth with an 8 mm pitch for superior load distribution and reduced wear.

Belts are abrasion-resistant urethane. They have carbon fiber reinforcement, which has ultra-high strength, low stretch, and excellent shock resistance. The teeth are nylon coated to protect the wear surface and minimize friction. Belts are interchangeable with Gates PolyChain GT belts. Temperature range is -65° to 185° F. Color is black.

Taper-lock pulleys mount with a taper-lock bushing (not included, see page 1092) for a more secure grip on the shaft than set screws. They are steel with a black-oxide finish.

Wide-Range Belt Tension Gauges

Measure belt tension up to 2,200 lbs. Position the sensor above your belt and pluck the belt like a guitar string to create vibration. Then, read the tension measurement on the display.

Gauge is for use with flat, round, and V-belts. It comes with a tuning fork for calibration, four AA batteries, and a plastic case.

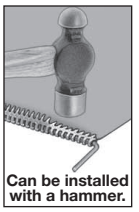
Tension Rating lbs.	Hz	Newtons		
1-2,200	10-400	1-9,990	1455T1	$1,350.74

For information about sizing belts, see page 1094.

Alligator Lacing Sets for Flat Belts

Often used to join conveyor belt seams, use this lacing for a tight hold with uniform tension across the width of your belt. Once installed, joints are flush with the belt surface on both sides, so teeth run smoothly over idlers and don't catch on conveyed materials. Use the included removable hinge pins to connect the lacing between two belt ends. For use with belts up to 12″ wide.

Stainless steel lacing has better corrosion resistance than steel and is nonmagnetic.



For Belt Thickness	Lg.	Lace No.★	No. of Belt Joints Per Set	Steel	Set	Stainless Steel	Set

★Lace numbers for stainless steel have an "S" added to the end.

V-Belt Sizer

Quickly determine the size of any belt. This tool measures belt top widths up to 1″ and outer circles up to 100″.

60375K2 ..... $74.16

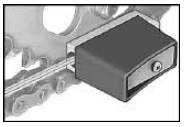
V-Belt and Pulley Groove Gauges

Measure V-belt cross sections and pulley groove depths to select the correct size belt. You'll get three gauges for belts (covering sizes A-E, 3V, 5V, and 8V belts) and eight gauges for grooves (covering A/B combination grooves). All of the gauges are made of blue plastic and are connected with a ball chain.

1937K33 ..... $9.50

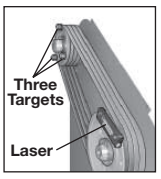
Pocket Parallel-Edge Alignment Laser

Slip this 2 1/2″ Lg. × 9/16″ Wd. × 1 1/4″ Ht. tool into your pocket so it's always on hand to align belts, pulleys, chain, and sprockets. Economical and simple to use, this laser has a machined aluminum surface that is adjusted parallel to the contact surface for precise alignment. Just press the tool against the side of your pulley or sprocket and project the laser along your belt or chain to the cardboard target (included) to see any misalignment. Laser is integrated Class II and has a 630-680 nm wavelength. Tolerance is 0.5 mm per 1 meter. Operates on two 1.5-volt batteries (included). Packed in a nylon pouch.



3273A1 ..... $91.75

Magnetic Laser Alignment Tool



Align pulleys, gears, sprockets, and just about anything ferrous with this aluminum magnetic laser alignment tool. It works with pulleys that have 3″ to 6 ft. diameters and 3″ to 20 ft. spacings. Place the adjustable magnetic targets onto the edge of one pulley and attach the laser line emitter on the edge of the other pulley. The laser light intersects the three targets to visually show any misalignment. Laser is Class II, 635 nm wavelength, accurate to ±0.07°, and 1/16″ wide at 30″ with a 70° spread. Tool includes two belt-tension testers for capacities of 30 to 300 lbs., three adjustable targets, a laser line emitter, and a plastic carrying case with foam inserts. Operates on two AAA batteries (included).

Alignment Tool 2309A46 $924.07

Urethane Belt Joining Kits

Everything you need to join flat, round, and V-belts made of urethane. Not for use with E-section V-belts. Use the clamp to secure the belt ends together, soften belt ends with the heating tool, and press the soft belt ends together to join. Kit also includes a belt cutter, pliers, and plastic case.

Heating tool operates on 120 volts AC and reaches a maximum temperature of 475° F. It has a 2″ wide blade and a 6-ft. cord with plug.

Coupling and Bearing Guards

Shield couplings and bearings from dirt and debris while protecting fingers and tools from moving parts. Guards are electrically nonconductive and resist chemicals, corrosion, and impact. They help meet OSHA standard 29 CFR 1910.219 for rotating machinery.

Guards come unassembled. They are orange polyethylene and include 304 stainless steel mounting hardware.

Nonslip Belt Coatings

Prevent slippage on flat, round, and V-belts and eliminate squeaking. These coatings also extend belt and pulley life by reducing tension and vibration.

4-oz. Squeeze Bottle—Use on rubber, urethane, canvas, and leather belts. Dries in 10 minutes.

10-oz. Aerosol Can—Use on rubber belts. Dries in 90 seconds.

Squeeze Bottle

10-oz. Aerosol Can	6155K27	13.00

Heavy Duty Belt and Roller Chain Tensioners

Maintain correct drive tension to ensure smooth operation for maximum power and a long service life. For use with idler sprockets and pulleys. Idler shaft (sold separately below) is required.

Tensioners are designed for use on large belt and chain drives. They're steel and are spring loaded to provide constant tension and automatic adjustments for pulsating loads.

Idler shafts are made of hardened and ground steel. Thread size is 3/14″-16 and thread length is 7/8″.

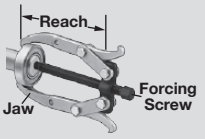
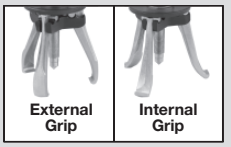
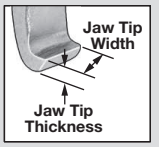
External Grip Pullers

About External and Internal Grip Pullers







Use jaw-style pullers to grip bearings, gears, wheels, bushings, and pulleys. When space allows, select a three-jaw puller for better stability and more evenly distributed pulling force.

Capacities listed should be used as a guide. If you can grip and reach an object, your puller will normally have enough power to pull it. When in doubt, choose the next larger puller size.

External Grip Pullers

Two Jaws with T-Handle Forcing Screw

Two Jaws with Tips at Both Ends

Three Jaws

Combination Two/Three Jaws with Tips at Both Ends

Grip bearings, gears, and wheels from the outside edge to pull them off a shaft. Pullers are steel with a steel forcing screw. Pullers with a 2 1/8″ reach have a T-handle forcing screw.

Pullers with combination two/three jaws have mounting holes in both a two-jaw and three-jaw configuration, so you can attach the jaws either way to suit your application.

Pullers with jaw tips on both ends have a different jaw tip size on each end for versatility in fitting bearings, gears, and wheels.

Replacement jaws are sold individually. For replacement forcing screws, see page 1115.

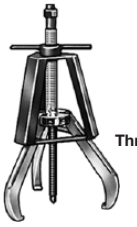
Quick-Hold External Grip Pullers

Two Jaws



Three Jaws

These pullers have a cage around the jaws that keeps them aligned so you can secure bearings and pulleys quickly. Use them to grip bearings, gears, and wheels from the outside edge to pull them off a shaft. Pullers are steel with an iron T-handle on the forcing screw. The cage has a black powder-coated finish.

Replacement jaws are sold individually.

Also Available: Replacement parts. Please ask for 6169K9 and specify forcing screw, pin, or jaw head, puller capacity, and puller style (two or three jaws).

Quick-Hold Reversible Jaw External/Internal Grip Pullers

Self-locking jaws hold these pullers in place for quick one-hand operation. Spring tension holds the jaws against the object being pulled, so you can tighten the locking nut.

To grip objects on the outside, attach the jaws with tips facing in. To grip objects from inside, attach the jaws with tips facing out. Pullers and forcing screws are steel.

Also Available: Replacement forcing screws and forcing screw tips. For forcing screws, please ask for 3765A62 and specify thread size and length. For forcing screw tips, please ask for 3765A1 and specify screw thread size.

Accessories

Pulling Plate—Allows you to remove objects with no gripping surface. Attach the plate to your object, then grip the edge of the plate with your puller. Includes four ¼″-20×¾″ long and four ¼″-28×1″ long screws. Made of steel.

Slide Hammers—Provide additional force for hard-to-remove objects. Attach the slide hammer in place of the forcing screw. Hammers are steel.

Pulling Plate

Hub and Fan Blade External Grip Pullers

A must-have for HVAC jobs, this puller makes quick work of removing press-fit hubs and fan blades from motor shafts. For hub-mounted components such as blower wheels, secure the puller with the included set screws. Fits motor shafts up to 0.625″ dia. and hubs up to 1¾″ dia. For fan blades, attach the removable jaws, hooking a jaw around each fan blade to secure. Jaws have ¼″ wide tips, a reach of 1½″, and are for 6″ max. OD. Puller body is aluminum; jaws and forcing screw are steel. Forcing screw is ½″-20×9″ long. Not rated for capacity.

59765K81 ..... $62.00

Set—Includes the puller and all of the accessories listed below. Comes in a plastic case.

59765K89 ..... $83.65

Accessories

Hub adapter is for use on hubs up to 2¾″ OD.

Long jaws are for 8½″ max. OD. They have a reach of 2⅝″.

Hub Adapter	59765K85	$18.50
Long Jaws (Set of 4)	59765K87	6.50

Forcing Screws and Accessories for Pullers

Make your old puller work like new by replacing worn forcing screws. Screws are steel.

Also Available: Shaft protectors, threaded adapters, and step-plate adapters. For shaft protectors, please ask for 6268K1 and specify OD. For threaded adapters, please ask for 3762A11 and specify male thread size. For step-plate adapters, please ask for 59875K1 and specify diameter.

Adjustable Face-Grip Puller Sets

Also known as steering wheel and flywheel pullers, you can change the bolt configuration on these pullers to fit a variety of tapered hole patterns. Pullers are steel. Not rated for capacity.

Set includes a small-hole puller (for up to 3¼″ OD; 4⅜″ reach; 4¾″ forcing screw), a large-hole puller (for up to 4⅝″ OD; 4¾″ reach; 5⅝″ forcing screw), and 12 cap screws (three of each: ⅜″-16×3½″ long, ⅜″-24×3″ long; 5/16″-18×3½″ long; 5/16″-24×3½″ long).

69805A25 ..... $85.64

Pullers & Puller Sets

For information about pullers, see page 1114.

Face-Grip Pullers

Compact

Standard (Shown with Bearing Separator)

Install and remove bearings, pulleys, and other press-fit parts with tapered holes. All pullers are steel.

Compact pullers are often used to remove timing gears, fan pulleys, and harmonic balancers. *Puller for 1½"-4¼" OD* includes two ⅜"-16, 3" long cap screws. *Puller for 2"-7¾" OD* accepts cap screws up to ½" dia. (not included, see pages 3128-3153). Reach depends on the length of your cap screws.

Standard pullers have two legs with end caps to protect the threads.

Optional legs for standard pullers allow you to change the reach of your puller or replace worn legs. Legs come in pairs.

Shaft Component Separators

V-Belt Pulley Separator

Separate bearings, collars, hubs, and other shaft-mounted items so you can remove them. After separating, use a puller (not included) to remove them from the shaft. Select a puller with a leg thread size that matches the thread size of your separator. All separators are steel.

Bearing separators can also be used with the two-jaw external grip pullers listed below and sold on page 1114.

V-belt pulley separators clamp into the V-groove of a pulley for a secure grip.

6342K22 ..... $394.17

Reversible Jaw External/Internal Grip Puller Sets for Tight Spaces

A flat profile and straight jaws fit in spots where other pullers do not—choose the set or use the individual components to create your own tool for use in external and internal pulling jobs.

A complete puller consists of a crossbar with forcing screw and a pair of jaws. To grip objects on the outside, attach jaws with tips facing in. To grip objects from inside, attach jaws with tips facing out. All components are steel.

5-Ton Capacity Set

Includes one crossbar with forcing screw, two jaw-mounting screws, and four pairs of different-sized jaws (one of each pair of jaws listed below for 5-ton capacity pullers).

6337K1 ..... $692.98

High-Force External Grip Puller Sets

Move the immovable—this puller set includes a hand pump and hydraulic cylinder so you can create up to 17½ tons of pulling force. Set includes a wood case, three threaded adapters, two pushing adapters, adjusting screw, crank handle, and the following:

Hydraulic Cylinder and Hand Pump
- Cylinder with 2" stroke
- Single-stage hand pump

Pump Accessory Set
- Pressure gauge
- Tee adapter and 45° elbow (for installing gauge)
- 6-ft. hydraulic hose
- Hose coupler (for connecting pump to cylinder)

External-Grip Hydraulic Puller
- 3-jaw: for up to 20" OD; 11½" reach
- Internal-grip attachment: for 1½"-9" OD; 4" reach
- 3-to-2 jaw head converter

Face-Grip Hydraulic Puller
- With end caps: for 5¾"-11¾" OD; 18½" reach
- Pair of extra legs: 22½" reach

Bearing Separator
- For ½"-9" OD

Puller Set	6315K73	$2,580.32
Repl. Pump Accessory Set	6315K79	263.23

Expanding-Collar Internal Grip Pullers

Set

Get a grip on objects with blind holes—these pullers have an expanding collet that secures bearings and bushings from inside.

Pin and **pin adapter** are required to expand the collet inside the object you're pulling. Pullers, pins, and pin adapter are steel.

When the collet is secure, use the **bridge** with the **forcing screw** and **forcing screw nut** (all sold separately) to apply force to the object you're removing. When you need additional force, use the bridge with the **slide hammer** (sold separately).

5991K22 ..... $558.61

Reversible Jaw External/Internal Grip Puller Sets

Grip objects on the outside or inside to tackle both types of pulling jobs. All components are steel. Set includes the following:

External Grip Pullers
- 2-jaw: for up to 6″ OD; 5½″ reach; 5-ton capacity
- 2-jaw: for up to 9″ OD; 5″ reach; 7-ton capacity
- 2/3-jaw: for up to 11″ OD; 8¾″ reach; 7-ton capacity

Reversible Jaw External/Internal Grip Puller with 5-lb. Slide Hammer
- 2/3-jaw: for 1½″-4¼″ ID and for 1½″-4½″ OD; 3½″ reach
- Jaw bar (converts 3-jaw puller to 2-jaw puller)

Internal Grip Puller with 1¾-lb. Slide Hammer
- 2-jaw: for ⅞″-2⅛″ ID; 1″ reach

Bridge-Style Internal Grip Puller
- 2-jaw: for ⅞″-2″ ID; 1″ reach

Adjustable Face-Grip Puller
- Puller with 5⅝″ forcing screw: for up to 4⅝″ OD; 4¾″ reach
- Six cap screws (three each: ⅜″-24 × 3″ long; ⅜″-16 × 3″ long)

Face-Grip Pullers
- Puller with 5½″ forcing screw: for 1½″-4¼″ OD
- Puller with 11⅝″ forcing screw: for 2″-7¾″ OD

Bearing Separators
- For ⅛″-1⅞″ OD
- For ½″-4¼″ OD

6349K42 ..... $714.79

Reversible Jaw External/Internal Grip Puller Sets with Locking Storage Box

Complete with a locking storage box, use the pullers in this set to tackle a wide variety of pulling jobs—use pullers to grip objects from the outside or the inside. To grip objects on the outside, attach puller jaws with tips facing in. To grip objects from inside, attach the puller jaws with tips facing out. Storage box is steel and measures 25¾″ Ht. × 29½″ Wd. × 10″ Dp. All pullers and components are steel. Set includes the following:

External Grip Pullers
- 2/3-jaw: for up to 7″ OD; 3¼″ reach; 5-ton capacity
- 2/3-jaw: for up to 10½″ OD; 5″ reach; 7-ton capacity
- Two sets of long-reach jaws (three for 5-ton capacity puller and three for 7-ton capacity puller)

Reversible Jaw External/Internal Grip Puller with 5-lb. Slide Hammer
- 2/3-jaw: for 1½″-4¼″ ID and for 1½″-4½″ OD; 3½″ reach
- Jaw bar (converts 3-jaw puller to 2-jaw puller)

Internal Grip Puller with 1¾-lb. Slide Hammer
- 2-jaw: for ½″-1½″ ID; ¾″ reach

Adjustable Face-Grip Puller
- Puller with 5⅝″ forcing screw: for up to 4⅝″ OD; 4¾″ reach
- Six cap screws (three each: ⅜″-24 × 3″ long; ⅜″-16 × 3″ long)

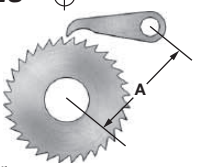
Face-Grip Puller
- Puller with 13″ forcing screw: for 1½″-4½″ OD

Bearing Separators
- For ⅛″-1⅞″ OD
- For ½″-4¼″ OD

69715A44 ..... $1,133.25

Ratcheting Gears and Pawls

CAD



Keep moving forward—these ratcheting gears allow motion in one direction and prevent backward motion. They have a plain bore for press-fitting to a shaft.

Pawl (sold separately) is required to prevent backward motion. Gears and pawls are ⅜″ thick stainless steel.

No. of Teeth	Pitch	OD	For Shaft Dia.	Ctr.-to-Ctr. Lg. (A)

Set

Includes the reversible-jaw puller with slide hammer and jaw bar as well as the crossbar, oil-seal puller hook, and three sets of jaws (2⅜″, 4⅛″, and 6½″ reaches).

6317K34 ..... $262.52

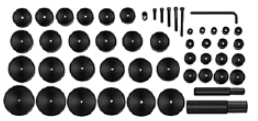
Bearing Ring and Seal Driver Sets

Make sure you have the proper size driver for bearing, seal, and bushing installation jobs.

Aluminum set includes an aluminum handle and six discs in 1.565″ OD, 1.75″ OD, 1.965″ OD, 2.325″ OD, 2.47″ OD, and 2.555″ OD sizes. Discs are flat on one side and tapered on the other.

Steel set includes two steel handles and 41 discs from ½″ to 3″ OD in 1/16″ increments. Discs are flat on both sides. Comes in a plastic case.

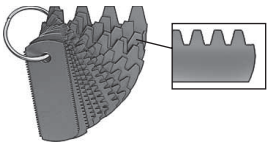
Aluminum Set



Steel Set

Aluminum Set	57195K81	$40.98
Steel Set	6053K11	486.79

Gear Tooth Pitch Identifiers



Ensure components are compatible by measuring the pitch of gears and racks.

Use identifiers for 14½° pressure angle on spur gears. Use identifiers for 14½° and 20° pressure angle on spur, bevel, helical, and miter gears.

	No. of Identifiers	For Pitch		
For 14½° Pressure Angle—Steel				
Inch	22	6, 7, 8, 9, 10, 11, 12, 14, 16, 18, 20, 22, 24, 26, 28, 30, 32, 36, 40, 48, 64, 80	2069A67	$59.82

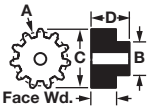
For 14½° and 20° Pressure Angle—Stainless Steel				
Inch	22	3, 4, 5, 6, 8, 10, 12, 16, 20, 24, 32	2069A12	181.22
Metric	26	1, 1.5, 2, 2.5, 3, 3.5, 4, 4.5, 5, 5.5, 6, 7, 8	2069A13	203.68

About Gears

For gears and racks to mesh correctly, they must have the same pressure angle and pitch. Gears with a 20° pressure angle have teeth with a wider profile than gears with a 14½° pressure angle, so they have greater strength to handle high loads.

To determine the pitch of a gear, divide the number of teeth by the pitch diameter. For example, a gear with 16 teeth and a ½″ pitch diameter has a pitch of 32. You can also use a gear tooth pitch identifier (see page 1117).

Metal Gears and Gear Racks—14½° Pressure Angle



Also known as spur gears, these gears have a 14½° pressure angle that maximizes contact between mating teeth for smooth operation. For gears and racks to mesh correctly, they must have the same pressure angle and pitch. Use these gears and racks with other components that have a 14½° pressure angle. All are steel.

Gears have a plain bore that comes machined for the shaft diameter listed; gears with a range are machinable up to the maximum size listed.

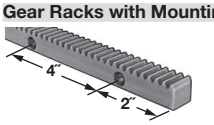
Gear Racks with Mounting Holes



These racks come with counterbored holes and finished ends, so no machining is required. They have 12 mounting holes spaced 4″ apart, starting 2″ from each end. Fasteners not included.

Pitch	Face Wd.	Ht.	For Screw Size	4-ft. Length	
24	1/4″	1/4″	No. 0	5170T1	$55.52

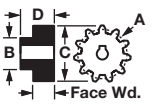
12	3/4″	3/4″	1/4″	5170T4	86.15

Finished-Bore Metal Gears—14½° Pressure Angle



Furnished ready to use, these gears have a finished bore with a set screw and keyway, unless noted. All have a 14½° pressure angle that maximizes contact between mating teeth for smooth operation. Gears are steel.

For gears and racks to mesh correctly, they must have the same pressure angle and pitch. Use these gears with other components that have a 14½° pressure angle.

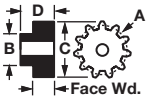
Plastic Gears and Gear Racks—14½° Pressure Angle



A light duty alternative to metal, these gears and racks have a 14½° pressure angle that maximizes contact between mating teeth for smooth operation. Gears and racks are molded nylon. Color is white.

For gears and racks to mesh correctly, they must have the same pressure angle and pitch. Use them with other components that have a 14½° pressure angle.

Gears are also known as spur gears. They have a plain bore for press-fitting to a shaft, unless noted.

Gear racks are cut to ensure end-to-end butting without interruption of tooth spacing.

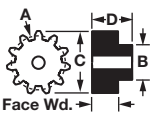
High-Precision Plastic Gears and Gear Racks—14½° Pressure Angle



These gears and racks are machined to produce closer dimensional tolerances than molded plastic. They have a 14½° pressure angle that maximizes contact between mating teeth for smooth operation. All are made of nylon.

For gears and racks to mesh correctly, they must have the same pressure angle and pitch. Use them with other components that have a 14½° pressure angle.

Gears, also known as spur gears, have a plain bore furnished in the minimum shaft dia. listed and are machinable up to the maximum shaft dia. listed.

Gear racks come longer than the length listed to allow room for finishing the ends.

Gears—Color is white.

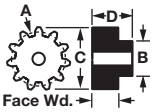
High-Load Metal Gears and Gear Racks—20° Pressure Angle



Also known as spur gears, these gears have teeth with a 20° pressure angle, which have a wider profile than 14½° teeth, so they have greater strength to handle high loads. For gears and racks to mesh correctly, they must have the same pressure angle and pitch. Use them with other components that have a 20° pressure angle.

Steel and **brass gears** have a plain bore for press-fitting to a shaft. **Stainless steel gears** are more corrosion resistant than steel and brass for use in damp environments. They have a finished bore and a set screw, so they are ready to mount.

Steel gear racks come longer than the length listed so you have room to finish the ends. **Stainless steel gear racks** are more corrosion resistant than steel and brass.

High-Load Metal Gear Rod Stock—20° Pressure Angle

Machine your own gears to fit the exact face widths and shaft diameters required. Rod stock has teeth with a 20° pressure angle, which have a wider profile than 14½° teeth, so they have greater strength to handle high loads. Rod stock is steel and comes in 1-ft. lengths.

For gears and racks to mesh correctly, they must have the same pressure angle and pitch; use gears made from this rod stock with other components that have a 20° pressure angle.

Speed-Reducing Worm Gears and Worms for 90° Angle Motion Transfer—14½° Pressure Angle

Use these gears to transmit motion at a 90° angle while reducing speed and increasing torque. The speed ratio is determined by the number of teeth on the gear. For example, a 20-tooth gear and its mating worm have a 20:1 ratio and reduce 200 rpm to 10 rpm. For gears and worms to mesh correctly, they must have the same pressure angle and pitch. Use these gears with worms that have a 14½° pressure angle. Worm is required to transmit motion.

Worm gears have a plain bore. *Bronze* worm gears have low friction and disseminate heat better than iron gears to provide a long service life for both the gear and the associated worm.

Worms are steel; they have right-hand threads and a finished bore with a keyway.

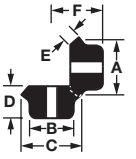
Gears for 90° Angle Motion Transfer—20° Pressure Angle



Transmit motion at a 90° angle while maintaining speed and torque. These gears are also known as miter gears. For two gears to mesh correctly, they must have the same pressure angle, pitch, and number of teeth. Use these gears with other gears that have a 20° pressure angle. Gears with a finished bore have a keyway and set screw.

Nylon and **steel gears** require two gears to make a set. They're not compatible with the high-load steel gears.

High-load steel gears have a spiral tooth design that allows them to withstand heavy loads at higher speeds than our other gears for 90° angle motion transfer.

About Shafts

When selecting a shaft, diameter and straightness tolerances are characteristics to consider. Tighter tolerances ensure uniform distribution of loads and improve accuracy and repeatability. The straighter your shafts are, the smoother your system will operate.

Hardened Shafts

The choice for linear motion applications, hardened shafts are used with linear ball bearings and linear sleeve bearings. All of our hardened shafts have micron finishes that are ideal for linear bearings, slides, and other precision applications. A shaft's finish affects frictional resistance and smoothness of travel as well as the efficiency and life of linear bearings. The lower the micron value, the smoother the finish.

Case hardness is a heat-treating process to harden the outside surface (the case) of shafts. Since bearings travel directly on shafts, they cause shafts to wear. Harder shafts provide more wear resistance. The higher the case value, the harder the shaft.

Drive Shafts

Designed for rotary motion applications, drive shafts are often used with gears, sprockets, and other power transmission components. They can also be used with rotary bearings. Many of these shafts have ANSI keyways for a secure hold in higher-torque applications. Most often, these shafts are not hardened, so they're easier to machine than hardened shafts.

Hardened Shafts

For technical drawings and 3-D models, go to mcmaster.com.

Don't see the shafts you need? Just tell us what you're looking for and we'll get it for you.

Hardened Shafts

Shafts are case hardened and precision ground for exacting diameter and straightness tolerances. They have a 9 rms micron finish (unless noted) for inch sizes; 12 rms micron finish (unless noted) for metric sizes. Straightness tolerance is 0.002″ per foot for inch sizes; 0.03 mm per 300 mm (unless noted) for metric sizes. Ends are beveled.

For shaft supports, see page 1134.

Shaft Dia.	Dia. Tolerance
1/8″-3/16″	–0.0005″ to –0.0002″
1/4″-1 1/4″, 1 3/4″	–0.001″ to –0.0005″
1 1/2″	–0.0011″ to –0.0006″
2″	–0.0013″ to –0.0006″

Shaft Dia.	Dia. Tolerance
3 mm	–0.008 to –0.002 mm
4-6 mm	–0.008 to 0 mm
8-10 mm	–0.009 to 0 mm
12, 15, 16 mm	–0.011 to 0 mm
13 mm	–0.017 to –0.006 mm
20-30 mm	–0.013 to 0 mm
35-50 mm	–0.016 to 0 mm

Inch Sizes—Steel

Shafts are 1566 steel; they're stronger than stainless steel shafts but are less corrosion resistant. Case hardness is Rockwell C60.

■ Shaft has a 10-16 rms micron finish; Rockwell hardness is C56-C58. ▲ Shaft has a 10-16 rms micron finish; Rockwell hardness is C52-C56.

Metric Sizes—Steel

Shafts are 1055 steel (except 3 mm and 13 mm Dia. shafts are 52100 steel and have a straightness tolerance of 0.025 to 0.050 mm per 300 mm). They're stronger than stainless steel shafts but are less corrosion resistant. Case hardness is Rockwell C59-C65.

Don't see the shafts you need? Just tell us what you're looking for and we'll get it for you.

Miniature Hardened Shafts

With their small diameters, miniature shafts are suited for miniature linear motion applications. Shafts are made of through-hardened 17-4 PH stainless steel for excellent corrosion resistance and good strength. All have a 10 rms microinch finish. Rockwell hardness is C40. Ends are beveled on 1/8" and larger diameters and on 2.5 mm and larger diameters.

Shaft Dia.	Dia. Tolerance	Straightness Tolerance

Aluminum Shafts

Move loads in corrosive environments. These Alloy 6061 aluminum shafts are strong, lightweight, and nonmagnetic. Surface hardness is Rockwell C70. Ends are beveled.

Anodized Aluminum Shafts— A 0.002" thick anodized layer resists chipping. All have a 10-16 rms micron finish. Straightness tolerance is 0.004" per foot.

Ceramic-Coated Aluminum Shafts— A 0.002" thick ceramic coating keeps weld splatter, molten glass, and paint from sticking to these shafts. All meet MIL-A-8625 and have a maximum 20 rms micron finish. Straightness tolerance is 0.001" per foot. *Note:* Ceramic-coated aluminum shafts are not intended for use with linear ball bearings.

Hardened Shafts with Machinable Ends

Machining a custom end for mounting is easier because 2" of each end has been annealed (softened). Shafts are case hardened and precision ground with exacting diameter and straightness tolerances. The nonannealed portion has a 9 rms micron finish. Shafts are 1566 steel for high strength. Case hardness is Rockwell C60. Straightness tolerance is 0.001" per foot. Ends are beveled.

Note: The annealed (softened) ends are not intended for linear travel.

Don't see the shafts you need? Just tell us what you're looking for and we'll get it for you.

Hardened Shafts with Tapped Ends

To save time and avoid the hassle of machining, the shaft ends come internally tapped. Shafts are case hardened and precision ground with exacting diameter and straightness tolerances. All have a 10-16 rms micron finish. Straightness tolerance is 0.002" to 0.001" per foot. Ends are beveled.

Steel Shafts— Made of 52100 steel, these shafts are stronger than stainless steel shafts but are less corrosion resistant. Case hardness is Rockwell C60-C64.

Stainless Steel Shafts— These Type 440C stainless steel shafts have good corrosion resistance but are not as strong as steel shafts. Case hardness is Rockwell C56-C58.

Hardened Shafts with Threaded Ends

Externally threaded ends have been machined for you—just mount these ready-to-use shafts through a through-hole and secure with a nut. Made of 52100 steel, all are case hardened and precision ground with exacting diameter and straightness tolerances. Shafts have a 10-16 rms micron finish. Case hardness is Rockwell C60-C64. Straightness tolerance is 0.002" to 0.001" per foot. Ends are beveled.

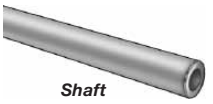
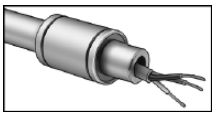
Tubular Shafts



Shaft



Shaft Shown with Bearing and Wiring (Not Included)

Lighter than solid shafts, tubular shafts reduce your total system weight and allow you to run various media such as electrical wiring, compressed air tubing, coolants, or lubricants through the center. Shafts are precision ground for tight diameter and straightness tolerances. Ends are beveled.

Inch Sizes—*Hardened shafts* are made of 52100 steel with an unfinished interior. All have a 9 rms micron finished OD. Case hardness is Rockwell C58. ID tolerance is ±5%. Straightness tolerance is 0.001″ per foot.

Unhardened shafts are made of 1026 steel with a finished interior. They come with material certification that includes a traceable lot number and physical test report. Shaft OD has a 32 rms micron finish; ID has a 20 rms micron finish. Hardness is Brinell 225. ID tolerance is 0.003″. Straightness tolerance is 0.003″ per foot.

Metric Sizes—Made of 1055 steel, these shafts are hardened with an unfinished interior. All have a 12 rms micron finished OD. Case hardness is Rockwell C59-C65. ID tolerance is ±5%. Straightness tolerance is 0.1 mm per 1,000 mm, unless noted.

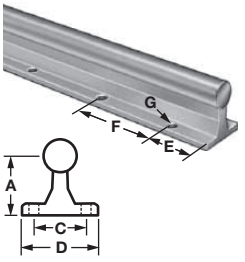
Hardened Shafts with Support Rail



Get shafts and support rails in one easy-to-install unit. Each consists of a Hardened Shaft with Tapped Mounting Holes (6499K or 6526K on page 1127) mounted on an aluminum alloy support rail.

Shafts are case hardened and precision ground for exacting diameter and straightness tolerances. Ends are beveled. *Inch sizes* have a 9 rms micron finish. Straightness tolerance is 0.001″ per foot. *Metric sizes* have a 12 rms micron finish. Straightness tolerance is 0.025 mm per 300 mm.

Use with open-style linear bearings (see pages 1135-1143).

Steel Shafts—Made of steel, these shafts are stronger than stainless steel shafts but are less corrosion resistant. Case hardness is Rockwell C60.

Stainless Steel Shafts—These Type 440C stainless steel shafts have good corrosion resistance but are not as strong as steel shafts. Case hardness is Rockwell C50-C55.

Ceramic-Coated Aluminum Shafts with Support Rail

A minimum 0.002″ thick ceramic coating keeps weld splatter, paint, and other contaminants from sticking to the shafts. Made of Alloy 6063-T6 aluminum, these shafts and integral support rail are lightweight, nonmagnetic, and have excellent corrosion resistance. Their one-piece design reduces vibration and assembly time. Ends are beveled.

All of these shafts meet MIL-A-8625 and have a maximum 20 rms micron finish. Rockwell hardness is C70. Straightness tolerance is 0.001″ per foot.

Use with open-style linear sleeve bearings (see pages 1141-1143).
Note: Shafts are not intended for use with linear ball bearings.

★ With only one mounting hole on each side, (F) dimension does not apply.

Hardened Shafts with Tapped Mounting Holes

The tapped holes on these shafts match the Support Rails for Hardened Shafts with Tapped Mounting Holes. Shafts are case hardened and precision ground for exacting diameter and straightness tolerances. All have a 9 rms micron finish. Ends are beveled. Straightness tolerance is 0.001″ per foot.

Steel Shafts— Shafts are 1566 steel; they're stronger than stainless steel shafts but are less corrosion resistant. Case hardness is Rockwell C60. Attach shaft to rail from beneath using socket-head cap screws on pages 3101-3103.

Stainless Steel Shafts— These Type 440C stainless steel shafts have good corrosion resistance, but are not as strong as steel shafts. Case hardness is Rockwell C50-C55. Attach shaft to rail from beneath using socket-head cap screws on pages 3115-3116.

Support Rails for Hardened Shafts with Tapped Mounting Holes

Support rails provide stability over an entire length of shaft, allow unlimited travel lengths, and eliminate bending under moderate to heavy loads. All of these rails are made of lightweight aluminum and are designed for use with open-style linear bearings (see pages 1135-1143). Cut to size or mount end-to-end to make longer lengths. Mounting holes (screws not included) match the Hardened Shafts with Tapped Mounting Holes.

Standard Support Rails— Made of Alloy 6061-T6 aluminum.

Low-Profile Support Rails— Made of Alloy 6063-T6 aluminum.

Drive Shafts

Steel Shafts— Made of 1566 steel, these shafts are stronger than stainless steel shafts but are less corrosion resistant. They are unhardened for easier machining. Rockwell hardness is C25. Ends are beveled.

Coated Steel Shafts— Made of 1045 steel, these coated shafts are stronger than stainless steel shafts but are less corrosion resistant.

Black-oxide coated shafts have a black-oxide coating for more corrosion resistance than uncoated steel shafts. Rockwell hardness is C20-C30.

Chrome-plated shafts have a 0.0001″-0.0005″ thick chrome plating for more corrosion resistance than black-oxide coated shafts. The *1/4″ and 3/8″ dia. shafts* have a surface hardness that is Rockwell C60-C65. The *1/2″ to 2″ dia. shafts* have a surface hardness that is Rockwell C68-C72.

Nitride-coated shafts have a 0.001″ thick nitride coating for more corrosion resistance than black-oxide coated shafts and chrome-plated shafts. Surface hardness is Rockwell C60-C65.

Type 303 Stainless Steel Shafts— Have good corrosion resistance but are not as strong as steel shafts. Rockwell hardness is B83. Ends are beveled.

Type 316 Stainless Steel Shafts— Have excellent corrosion resistance but are not as strong as steel shafts. Rockwell hardness is C20. Ends are beveled.
Note: Not for use with ball bearings.

Don't see the shafts you need? Just tell us what you're looking for and we'll get it for you.

Miniature Drive Shafts

Diameters are sized for miniature rotary applications. These shafts also work well with miniature sprockets, pulleys, and gears. Ends are beveled on 1/8" and larger diameters and on 2.5 mm and larger diameters.

Steel Shafts— Made of 12L14 steel, these shafts are stronger than stainless steel shafts but are less corrosion resistant. Hardness is Brinell 167.

Type 303 Stainless Steel Shafts— Have good corrosion resistance but are not as strong as steel shafts. Rockwell hardness is B83.

Type 316 Stainless Steel Shafts— Have excellent corrosion resistance but are not as strong as steel shafts. Rockwell hardness is B83.

Shaft Dia.	Dia. Tolerance	Straightness Tolerance
1/32"-3/32"	–0.0002" to 0"	Not Rated

Don't see the shafts you need? Just tell us what you're looking for and we'll get it for you.

Fully Keyed Drive Shafts

For a secure hold in higher-torque applications, an ANSI keyway runs the entire length of the shaft (keys not included; see pages 3400-3403). Straightness tolerance is 0.012″ per foot for inch sizes and 0.305 mm per 300 mm for metric sizes. Ends are beveled.

Steel Shafts—Made of 1045 steel, these shafts are stronger than stainless steel and aluminum shafts but are less corrosion resistant. Rockwell hardness is B95.

Type 304 Stainless Steel Shafts—Have good corrosion resistance but are not as strong as steel shafts. Rockwell hardness is B85.

Type 316 Stainless Steel Shafts—Have excellent corrosion resistance but are not as strong as steel shafts. Rockwell hardness is B85.

Aluminum Shafts—Made of Alloy 2024-T4 aluminum, these shafts are lightweight and have more corrosion resistance than steel shafts. Hardness is Brinell 120.

Don't see the shafts you need? Just tell us what you're looking for and we'll get it for you.

Fully Keyed Precision Drive Shafts with Certification

In addition to diameter tolerances that are twice as tight as the Fully Keyed Drive Shafts, these ultra-straight shafts include a traceable lot number and physical test report. An ANSI keyway runs the entire length of the shaft for a secure hold in higher-torque applications (keys not included; see pages 3403-3403).

Shafts are 1045 steel. Hardness is Rockwell C14-C28. Straightness tolerance is 0.003″ per foot. Ends are beveled.

Partially Keyed Drive Shafts

Shown with Included Key

With a 4″ long ANSI keyway on one end and a 14″ long ANSI keyway on the other, keys won't slide out of position during assembly and operation. All include one 2″ long key and one 4″ long key. Ends are beveled.

Steel Shafts—Made of 1117 steel, these shafts are stronger than stainless steel shafts but are less corrosion resistant. Hardness is Brinell 156. Straightness tolerance is 0.01″ per foot.

Stainless Steel Shafts—These Type 303 stainless steel shafts have good corrosion resistance but are not as strong as steel shafts. Hardness is Rockwell B80. Straightness tolerance is 0.003″ per foot.

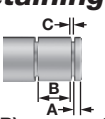
Shafts with Retaining Ring Grooves



Multiple grooves (four or five on one end; two on the other) allow mounting flexibility, positioning bearings in a fixed spot, and using these shafts as an axle. All are Type 303 stainless steel and have good corrosion resistance. Hardness is Rockwell B83. Straightness tolerance is 0.0008″ per inch. Ends are beveled. For retaining rings (not included), see page 3406.

Don't see the shafts you need? Just tell us what you're looking for and we'll get it for you.

Dual-Diameter Shafts

For mounting and connecting flexibility, each shaft has two different diameters. Choose from shafts that step down on one or both ends. Straightness tolerance is 0.003″ per foot. Ends are beveled.

Steel Shafts— Made of 1045 steel, these shafts are stronger than stainless steel shafts but are less corrosion resistant. Hardness is Brinell 150.

Stainless Steel Shafts— These Type 303 stainless steel shafts have good corrosion resistance but are not as strong as steel shafts. Hardness is Brinell 160.

Idler Shafts

Count on our specially designed shafts to hold your bearings in idler applications. All shafts are made of steel. For idler rollers, see pages 1169-1170.

Thread-Mount Shafts— Mount in a tapped hole. A retaining-ring groove with included retaining ring and spacers position your bearing.

Flange-Mount Shafts— For a more secure hold, these shafts include washers and a nut to position your bearing.

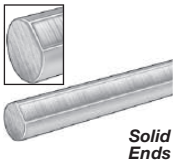
D-Profile Shafts

Looking for a secure connection when working with set screws? A D-shaped profile provides a flat surface area, which allows set screws to dig into the shaft. The flat surface width is equal to 50% of the diameter size. Diameter tolerance is –0.003″ to 0″. Straightness tolerance is 0.012″ per foot. Ends are beveled.

Steel Shafts with Solid Ends— Made of 1045 steel, these shafts are stronger than stainless steel shafts but are less corrosion resistant. Rockwell hardness is B90.

Stainless Steel Shafts with Solid Ends— These Type 303 stainless steel shafts have good corrosion resistance but are not as strong as steel shafts. Rockwell hardness is B83.

Steel Shafts with One Tapped End— Just like the steel shafts with solid ends but with an internally tapped end.



Solid Ends

One Tapped End

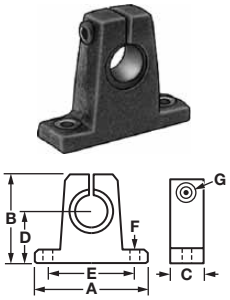
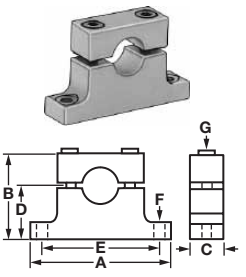
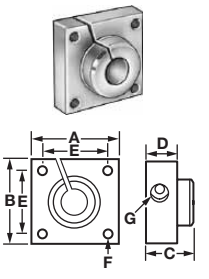
Shaft Supports



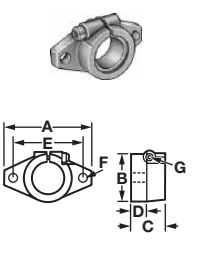
Base Mount, Inch and Metric Sizes



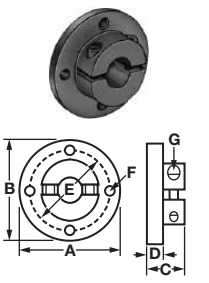
Quick-Access Base Mount



Flange Mount, Inch Sizes



Flange Mount, Metric Sizes



Quick-Access Flange Mount

Brace the ends of your linear shafts when working with light to medium loads where shaft alignment is not critical. For use with closed linear bearings.

Base Mount—Tolerance for (D) dimension is ±0.002″ for inch sizes and ±0.02 mm for metric sizes.

Quick-Access Base Mount—Innovative two-piece design lets you quickly remove the top of the support for access to your shaft. Tolerance for (D) dimension is ±0.003″.

Flange Mount—*Inch sizes* have a four-bolt design. *Metric sizes* have a two-bolt design.

Quick-Access Flange Mount—Innovative two-piece design lets you quickly remove the top of the support for access to your shaft. All have a four-bolt design.

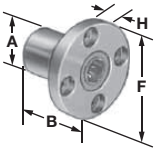
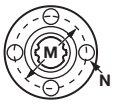
Combination Linear/Drive Ball Bearings and Spline Shafts

Standard Bearing





Flanged Bearing

Spline Shaft

Pair a ball bearing with an end-supported spline shaft to transmit rotary torque while allowing the bearing to move linearly along the shaft. Also called ball splines, these ball bearings and spline shafts offer low friction and low backlash. Torque capacity is the maximum rotational load a bearing can withstand without deforming.

All bearings are closed style and can be mounted in any position without affecting load capacity. They also have a fixed-alignment design and are for use where shaft misalignment is unlikely. Shell and balls are steel. Maximum temperature is 176° F. *Note:* Bearings will only fit the spline shaft listed on the same line in the table.

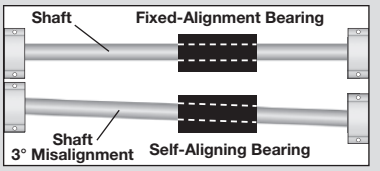
About Linear Bearings

Linear Ball Bearings (pages 1135-1140)— The choice for smooth linear motion in debris-free environments. Compared to linear sleeve bearings, they operate with less friction, so you can run them at higher speeds. Linear ball bearings are for use on hardened shafts. They usually require lubrication.

Linear Sleeve Bearings (pages 1140-1143)— Because they do not require lubrication, linear sleeve bearings outperform linear ball bearings in dirty environments. They also take on higher loads. Use with hardened or unhardened shafts.

Parallel-Shaft Applications for Linear Sleeve Bearings— For best results in this common setup, use a *fixed-alignment bearing* on one shaft and a *self-aligning bearing*, which accommodates minor shaft misalignment, on the other.



Mounted Linear Ball Bearings

A complete mounted linear bearing comes ready to use with the bearing installed inside a 6061 aluminum housing. They have end seals to keep lubricants in and dirt out. Temperature range is -4° to 176° F, unless noted. For use with hardened shafts made of steel, chrome-plated steel, or stainless steel with a hardness of at least Rockwell C50. Bearings are replaceable.

Bearings for Support Rail Shafts— Designed for applications requiring maximum rigidity.

Inch bearings are self aligning and handle up to 1° of shaft misalignment in any direction, unless noted. Bearing shell is acetal; balls are steel. Center height tolerance (G) is ±0.001″, unless noted.

Metric bearings are fixed-alignment style and are for use where shaft alignment is unlikely. Bearing shell and balls are steel. Center height tolerance is ±0.020 mm.

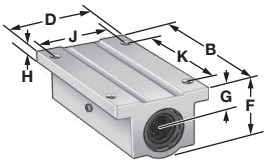
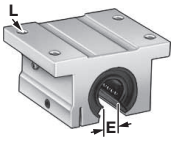
High-Load Mounted Linear Ball Bearings



For Round Shafts



For Support Rail Shafts

Designed to handle heavy loads, these bearings have the highest load capacities of any mounted linear ball bearings we offer. The bearings are self aligning and handle up to ½° of shaft misalignment in any direction. They have end seals to keep lubricants in and dirt out. Housing is 6061 aluminum, bearing shell is acetal, and balls are steel. Center height tolerance is ±0.003″. Maximum temperature is 185° F. Bearings are replaceable.

For use with hardened shafts made of steel, chrome-plated steel, or stainless steel with a hardness of at least Rockwell C50.

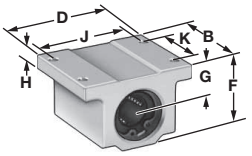
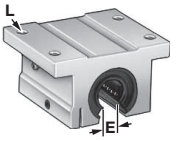
Corrosion-Resistant Mounted Linear Ball Bearings



Aluminum Housing for Round Shafts

Acetal Housing for Round Shafts



Aluminum Housing for Support Rail Shafts

Outdoor as well as mild chemical environments are no problem for these bearings. All have stainless steel balls for corrosion resistance. End seals keep lubricants in and dirt out. Temperature range is -4° to 176° F.

Bearings for Support Rail Shafts—Designed for applications requiring maximum rigidity. Bearings are replaceable.

Bearings with 6061 aluminum housing take on heavier loads than bearings with an acetal housing. They have smooth-running, self-aligning bearings that handle up to 1° of shaft misalignment in any direction. The bearing shell is acetal. Center height tolerance (G) is ±0.001″. For use with hardened shafts made of steel, chrome-plated steel, or stainless steel with a hardness of at least Rockwell C60. Bearings are replaceable.

Bearings with acetal housing are lighter in weight and more corrosion resistant than bearings with an aluminum housing. They have fixed-alignment bearings and are for applications where shaft misalignment is unlikely. The bearing shell is nickel-plated steel. Center height tolerance is ±0.004″. For use on hardened shafts made of steel with a hardness of at least Rockwell C60 or made of stainless steel with a hardness of at least Rockwell C56. Bearings are not replaceable.

Adjustable Mounted Linear Ball Bearings

Use the adjustment screw in the housing to tighten or loosen the snugness (also known as preload) of the bearing to your shaft. They are for use with round, end-supported shafts. They are self aligning to compensate for 3° of shaft misalignment. End seals keep lubricants in and dirt out. Housing is cast iron. Bearing shell and balls are steel. Center height tolerance (G) is ±0.005″. Maximum temperature is 180° F.

For use with end-supported, hardened shafts made of steel with a hardness of at least Rockwell C60 or made of stainless steel with a hardness of at least Rockwell C53.

Flange-Mounted Linear Ball Bearings

The flanged housing makes these bearings a good solution for vertical linear motion applications. All are for use with round, end-supported shafts and have a fixed alignment design for use where shaft misalignment is unlikely. End seals keep lubricants in and dirt out. Use with hardened steel or stainless steel shafts with a hardness of at least Rockwell C56.

Steel Bearings—Housing, bearing shell, and balls are steel. Temperature range is -4° to 176° F.

Stainless Steel Bearings—Housing, shell, and balls are stainless steel for corrosion resistance. Temperature range is -4° to 248° F.

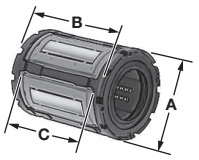
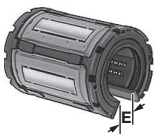
Self-Aligning Linear Ball Bearings



For Round Shafts



For Support Rail Shafts

Our basic self-aligning bearings are smooth running and handle up to ½° of shaft misalignment in any direction. Bearings have end seals (unless noted) to keep lubricants in and dirt out. Maximum temperature is 176° F. To install, slide bearings into a housing (not included) and secure with two external retaining rings (sold individually). For use with hardened shafts made of steel, chrome-plated steel, or stainless steel with a hardness of at least Rockwell C60, unless noted.

Bearings for Support Rail Shafts—Designed for applications requiring maximum rigidity.

Standard bearings have an acetal shell and steel balls.

Corrosion-resistant bearings have an acetal shell and stainless steel balls.

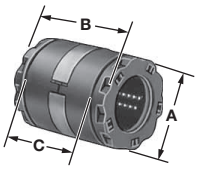
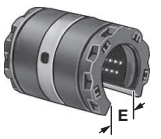
■Hardness must be at least Rockwell C50. ▲No end seals.

High-Load Self-Aligning Linear Ball Bearings



For Round Shafts



For Support Rail Shafts

Designed to handle heavy loads, these bearings have higher load capacities than comparable linear ball bearings. They are for use with round, end-supported shafts and handle up to ½° of shaft misalignment in any direction. Bearings have end seals (unless noted) to keep lubricants in and dirt out. Maximum temperature is 176° F.

To install, slide bearings into a housing (not included) and secure with two external retaining rings (sold individually), except bearing for 3/16″ shaft dia. does not accept retaining rings. For use with hardened shafts made of steel, chrome-plated steel, or stainless steel with a hardness of at least Rockwell C50, unless noted.

Bearings for Support Rail Shafts—Designed for applications requiring maximum rigidity.

Standard bearings have an acetal shell and steel balls.

Corrosion-resistant bearings have an acetal shell and stainless steel balls.

▲No end seals. ★Hardness must be at least Rockwell C60.

Fixed-Alignment Linear Ball Bearings

The popular choice for applications where shaft misalignment is unlikely.

To install, slide bearings into a housing (not included) and secure with two external retaining rings (sold individually). For use with hardened shafts made of steel, chrome-plated steel, or stainless steel with a hardness of at least Rockwell C56, unless otherwise indicated.

Bearings for Support Rail Shafts—Designed for applications requiring maximum rigidity.

Steel bearings have a steel shell and balls. End seals keep lubricants in and dirt out. Maximum temperature is 176° F.

High-temperature steel bearings have a steel shell and balls. They do not have end seals. Maximum temperature is 500° F.

Stainless steel bearings have a 440C stainless steel shell and stainless steel balls for corrosion resistance. End seals keep lubricants in and dirt out. Temperature range is -4° to 248° F.

High-temperature stainless steel bearings have a 440C stainless steel shell and stainless steel balls for corrosion resistance. They do not have end seals. Maximum temperature is 600° F (load capacity is 60% at maximum temperature). For use with hardened shafts made of stainless steel with a hardness of at least Rockwell C56.

▲Housing ID is 0.001" less than min. shown and 0.003" more than max. shown.

Linear and Rotary Ball Bearings

Engineered for simultaneous linear and rotary motion, these bearings allow rotary speeds up to 3,600 rpm. They are for use with round, end-supported shafts. The fixed-alignment design is for use where shaft misalignment is unlikely. End seals keep lubricants in and dirt out. Shell and balls are steel. Maximum temperature is 200° F.

To install, slide bearings into a housing (not included) and secure with two retaining rings (sold individually). For use with hardened shafts made of steel or chrome-plated steel with a hardness of at least Rockwell C58; stainless steel with a hardness of at least Rockwell C50.

Note: When used for combination linear/rotary motion, the load capacity must not exceed the dynamic load capacity for rotary motion listed.

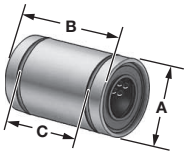
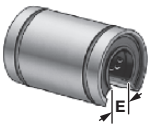
Metric Fixed-Alignment Linear Ball Bearings



For Round Shafts



For Support Rail Shafts

The metric option for applications where shaft misalignment is unlikely.

To install, slide bearings into a housing (not included) and secure with two external retaining rings (sold individually) except bearings for 3 and 4 mm shaft diameters, which do not have ring grooves. For use with hardened shafts made of steel with a hardness of at least Rockwell C60, or stainless steel with a hardness of at least Rockwell C56.

Bearings for Support Rail Shafts—Designed for applications requiring maximum rigidity.

Steel bearings have a steel shell and balls. End seals keep lubricant in and dirt out (except bearings for 3 and 4 mm shaft diameters, which do not have end seals). Maximum temperature is 176° F.

High-temperature steel bearings have a steel shell and balls. They do not have end seals. Maximum temperature is 230° F.

High-temperature stainless steel bearings have a 440C stainless steel shell and stainless steel balls for corrosion resistance. End seals keep lubricants in and dirt out. Temperature range is -4° to 248° F.

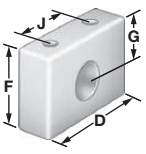
Sleeve Bearing Blocks for Washdown Environments



With Two Mounting Holes

With Four Mounting Holes

Made from a single piece of slippery UHMW plastic, these bearings have no cracks or crevices, so they're easy to clean. All are for use with round, end-supported shafts and have a fixed-alignment design for applications where shaft misalignment is unlikely. Temperature range is -200° to 180° F.

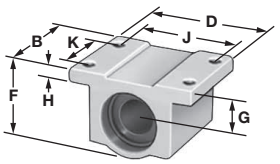
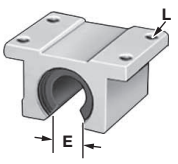
Mounted Linear Sleeve Bearings

Virtually maintenance free, these bearings have slippery, chemical-resistant liners that don't require added lubrication. They are designed to be dimensionally compatible drop-in replacements for mounted linear ball bearings.

Bearings for support rail shafts are designed for applications requiring maximum rigidity.



For Round Shafts



For Support Rail Shafts

Fixed Alignment

For use where shaft misalignment is unlikely. Liner is chemical-resistant PTFE. Shell and housing are 6061 aluminum. Shaft clearance is 0.001″. Temperature range is -400° to 375° F. For use with shafts that have a hardness of at least Rockwell B25 and 8-16 rms micron finish.

Self Aligning

Allow up to 1/2° of shaft misalignment in any direction. Liner is chemical-resistant, anodized Frelon (a PTFE-filled composite) for wear resistance and strength. Shell and housing are aluminum. Temperature range is -400° to 400° F.

For use with steel shafts that have a hardness of at least Rockwell C60 and an 8-16 rms micron finish. Note: Not for use with bare aluminum, chrome-plated steel, or 300 series stainless steel shafts.

To Order: Please specify tight shaft clearance (0.0005″) or extra shaft clearance (0.0015″). Bearings with 0.0005″ shaft clearance are best for precision applications. Bearings with 0.0015″ shaft clearance are less likely to bind on your shaft than bearings with 0.0005″ shaft clearance.

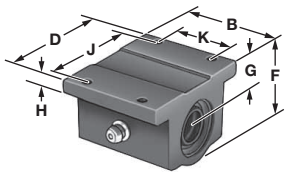
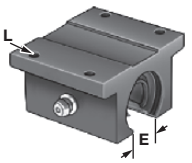
High-Speed Mounted Linear Sleeve Bearings



For Round Shafts



For Support Rail Shafts

A 0.002″ thick ceramic liner makes high speeds as well as rapid acceleration and deceleration possible. Bearings are self aligning and handle up to 2° of shaft misalignment in any direction. All require lubrication and are designed to be dimensionally compatible drop-in replacements for linear ball bearings. A grease fitting allows easy lubrication. Seals keep lubricants in and dirt out. Bearing shell and housing are 6061 aluminum. Shaft clearance is 0.0005″ to 0.0006″. Center height tolerance (G) is ±0.003″. Temperature range is -200° to 400°F.

For use with steel and aluminum shafts that have a hardness of at least Rockwell C60 and an 8-16 rms micron finish. Note: Not for use with ceramic-coated aluminum or 300 series stainless steel shafts.

Bearings for support rail shafts are designed for applications requiring maximum rigidity.

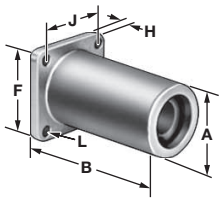
Flange-Mounted Linear Sleeve Bearings



Chemical Resistant

High Speed

The flange-mount design is good for vertical linear motion applications. Shell and housing are 6061 aluminum. Bearings are for use on shafts with a hardness of at least Rockwell C35 and an 8-12 rms micron finish.

Chemical-Resistant Bearings—The Frelon liner on these bearings allows them to stand up to a wider range of chemicals than other flange-mounted linear sleeve bearings. They are for use with steel, stainless steel, or ceramic-coated aluminum shafts. Note: Do not uses with bare aluminum or chrome-plated steel shafts. All are self aligning to compensate for up to 1/2° of shaft misalignment. Temperature range is -400° to 400°F. **To Order:** Please specify tight shaft clearance (0.0005″) or extra shaft clearance (0.0015″). Bearings with 0.0005″ shaft clearance are best for precision applications. Bearings with 0.0015″ shaft clearance are less likely to bind on your shaft than bearings with 0.0005″ shaft clearance.

High-Speed Bearings—A 0.002″ thick ceramic liner makes high speeds as well as rapid acceleration and deceleration possible. Handle up to 2° of shaft misalignment. A grease fitting allows easy lubrication. Seals keep contaminants out. Bearings are for use with steel, stainless steel, or aluminum shafts. For optimum performance, these bearings require lubrication. Shaft clearance is 0.0005″. Temperature range is -200° to 400°F.

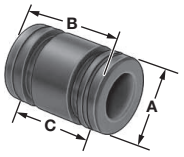
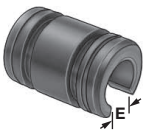
Self-Aligning Linear Sleeve Bearings



For Round Shafts



For Support Rail Shafts

Our basic self-aligning bearings allow up to 2° of shaft misalignment in any direction. Virtually maintenance free, they have a nonabrasive, chemical-resistant PTFE liner that doesn't require lubrication. All are designed to be dimensionally compatible drop-in replacements for linear ball bearings. Shell is aluminum with a 0.002″ thick ceramic coating for added corrosion resistance. Shaft clearance is 0.001″ for 1/4″ to 1 1/4″ shaft dia.; 0.0015″ for 1 1/2″ and 2″ shaft dia. Temperature range is -400° to 375°F.

To install, slide bearings into a housing (not included) and secure with two external retaining rings (sold individually). For use with stainless steel or aluminum shafts that have a hardness of at least Rockwell B25 and an 8-16 rms micron finish.

Bearings for support rail shafts are designed for applications requiring maximum rigidity.

Fixed-Alignment Linear Sleeve Bearings

Select these bearings for applications where shaft misalignment is unlikely. All are designed to be dimensionally compatible drop-in replacements for linear ball bearings. To install, slide bearings into a housing (not included) and secure with two external retaining rings (sold individually).

Bearings for support rail shafts are for applications requiring maximum rigidity.

Chemical-Resistant Bearings—Have a chemical-resistant Frelon liner (a PTFE-filled composite) for wear resistance and strength. Temperature range is -400° to 400°F. For use with steel shafts that have a hardness of at least Rockwell C35.

Bearings with an aluminum shell have good corrosion resistance and are for use on shafts that have an 8-12 Ra micron finish. Metric sizes have a shaft clearance of 0.0005″. Note: Not for use with bare aluminum, chrome-plated steel, or 300 series stainless steel shafts. To Order: For inch sizes, please specify tight shaft clearance (0.0005″) or extra shaft clearance (0.0015″). Bearings with 0.0005″ shaft clearance are best for precision applications. Bearings with 0.0015″ shaft clearance are less likely to bind on your shaft than bearings with 0.0005″ shaft clearance.

Bearings with a 316 stainless steel shell have excellent corrosion resistance and are for use on shafts that have an 8-16 rms micron finish. Shaft clearance is 0.0005″. Note: Not for use with chrome-plated steel.

Electrical-Insulating Bearings—These fiberglass bearings are lightweight, nonmagnetic, and won't conduct electricity. They have a chemical-resistant PTFE liner with no abrasive fillers. Shaft clearance is 0.001″. Temperature range is -400° to 375°F. For use with steel or stainless steel shafts that have a hardness of at least Rockwell B25 and an 8-16 rms micron finish.

Food-Grade Bearings—Made of FDA-listed materials for use in food applications, these bearings also have excellent chemical and corrosion resistance. All bearings have a 304 stainless steel shell and Rulon 641 liner. Shaft clearance is 0.001″. Temperature range is -400° to 375°F. For use with steel or stainless steel shafts that have a hardness of at least Rockwell B25 and an 8-16 rms micron finish.

Dust-Resistant Bearings—Ridges on the inside of these bearings wipe away dust and debris. Bearings are made entirely of lightweight, corrosion- and chemical-resistant PTFE. Shaft clearance is 0.0013″ to 0.0036″. Temperature range is -40° to 194°F. For use with steel and stainless steel shafts that have a hardness of at least Rockwell C50 and a 4-16 rms micron finish.

High-Speed Bearings—A ceramic liner makes high speeds as well as rapid acceleration and deceleration possible. They require a thin film of lubrication. Shell is 6061 aluminum for good corrosion resistance. Shaft clearance is 0.0005″ for 1/4″ to 5/8″ shaft dia.; 0.0008″ for 3/4″ and 1″ shaft dia. Temperature range is -200° to 400°F. For use with steel and stainless steel shafts with a hardness of at least Rockwell C60 and an 8-16 rms micron finish.

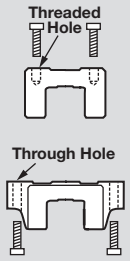
About Linear-Motion Carriages and Guide Rails



Carriage Mounting Options

We offer a variety of carriages and guide rails to meet your precision automation needs.

Ball-Bearing Carriages (pages 1144-1148)— Our most common carriages have ball bearings to smoothly move your loads at high speeds with low friction. Ball-bearing carriages are some of the highest capacity linear motion products we offer. They're often used in parallel rail configurations.

Sleeve-Bearing Carriages (pages 1148-1149)— An economical alternative to ball-bearing carriages, these products are great for harsh environments because they are less likely to be hindered by dirt and debris. They do, however, require greater force to move because they create more friction than ball-bearing carriages.

Carriage Mounting Options

Threaded-hole carriages allow mounting from the top of your load into the carriage. They generally have a smaller footprint than through-hole carriages. All mounting holes are threaded.

Through-hole carriages have a flanged design with unthreaded or threaded mounting holes through the flange. This design generally allows mounting from the top of your load into the carriage as well as from the bottom of the carriage into your load.

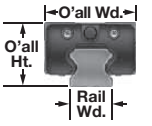
Carriages and guide rails generally provide greater precision and rigidity in a smaller footprint than shafts and pillow-block linear ball bearings starting on page 1135. For lighter loads or less-precise applications, you may wish to consider low-friction slides or track rollers starting on page 1150.

Ball-Bearing Carriages and Guide Rails

Threaded-Hole Carriage and Guide Rail (Sold Separately)

Through-Hole Carriage and Guide Rail (Sold Separately)

Profile of Guide Rails with Carriage



Standard Guide Rail

High-Load Guide Rail

Our most popular carriages and guide rails provide precise, rigid linear motion. Install them in any position without affecting load capacity. Maximum temperature is 176° F.

Threaded-hole carriages allow mounting from the top of your load into the carriage. ***Through-hole carriages*** allow mounting from the top of your load into the carriage as well as from the bottom of the carriage into your load (unless noted).

Standard Carriages— Made of steel with rubber end seals to keep lubricants in and dirt out. All have steel ball bearings and four mounting holes.

High-Load Carriages— Steel cylindrical roller bearings allow high load capacities. An internal retainer separates the roller bearings and keeps them moving uniformly, providing smoother, quieter operation. Carriages are made of steel with an internal tube that delivers oil to the roller bearings. All have six mounting holes.

Guide Rails— Made of hardened and ground steel. High-load guide rails include mounting screws. ***To Order:*** For all rails, please specify length from the choices listed below, or go to www.mcmaster.com and specify the part number listed to see other available lengths. ***Also Available:*** Mounting hole plugs for standard guide rails. Please ask for 6709K9 and specify your rail's socket head cap screw size.

Also Available: Replacement carriages and guide rails. Please ask for 6709K999 and specify the manufacturer and manufacturer's model number for the carriage or guide rail. If you are ordering a guide rail, specify the length of the rail you need.

Note: Carriages can only be used with guide rails listed on the same line in the table.

★ Mount from top of load into carriage only.

Extended-Life Ball-Bearing Carriages and Guide Rails

Compared to conventional carriages, these will last longer. Carriages are made of steel with rubber end seals to keep lubricants in and dirt out. All have steel ball bearings and four mounting holes. Maximum temperature is 176° F.

Threaded-hole carriages allow mounting from the top of your load into the carriage. ***Through-hole carriages*** allow mounting from the top of your load into the carriage as well as from the bottom of the carriage into your load.

Versa-Mount Carriages— An internal resin cage separates the ball bearings to minimize noise, reduce heat buildup, and eliminate ball collisions to extend the life of the bearings. Versa mount means you can install these carriages in any position without affecting load capacity.

Horizontal-Mount Carriages— A compact design gives these carriages high rigidity and stability, which makes them the choice for horizontal mounting. The orientation of the ball bearings on the guide rails extends the life of the bearings. In addition to rubber end seals, these carriages also have rubber side seals for added protection from contaminants.

Quiet-Ride Horizontal-Mount Carriages— Just like the *Horizontal-Mount Carriages*, but with an internal plastic cage that separates the ball bearings to minimize noise, reduce heat buildup, and eliminate ball collisions to extend the life of the bearings.

Guide Rails— Made of hardened and ground steel. **To Order:** For rails, please specify length from the choices listed below. **Also Available:** Mounting hole plugs. Please ask for 6709K9 and specify your rail's socket head cap screw size.

Note: Carriages can only be used with guide rails listed on the same line in the table.

Guide Rail Covers

Also known as linear way covers, these easy-to-install covers protect your carriages and guide rails from dirt, dust, chips, and other contaminants. Highly resistant to coolants and oils, they're made of 0.01" thick PVC-coated seamless polyester fabric, bonded to PVC stiffeners. Maximum temperature is 170° F.

To Order: Please specify expanded length in feet (compressed length is 1/13 the expanded length).

Mounting kits include everything you need to mount the cover on both ends of your guide rail via clip-on, compression, hook-and-loop, flange mounting, or double-sided tape.

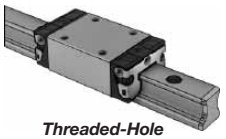
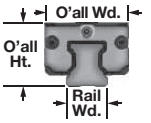
Maintenance-Free Ball Bearing Carriages and Guide Rails



Threaded-Hole Carriage and Guide Rail (Sold Separately)

Through-Hole Carriage and Guide Rail (Sold Separately)

Profile of Guide Rail with Carriage



An internal reservoir continuously supplies built-in oil for maintenance-free operation, making these carriages and guide rails great for hard-to-reach places where maintenance would be difficult to perform. They can be mounted in any position.

Threaded-hole carriages allow mounting from the top of your load into the carriage. ***Through-hole carriages*** allow mounting from the top of your load into the carriage as well as from the bottom of the carriage into your load.

Maintenance-Free Carriages and Guide Rails— The carriages and ball bearings are steel; guide rails are hardened and ground steel.

Corrosion-Resistant Maintenance-Free Carriages and Guide Rails— The carriages, ball bearings, and guide rails are 400 series stainless steel.

To Order: For all guide rails, please specify length from the choices listed below.

Note: Carriages can only be used with guide rails listed on the same line in the table.

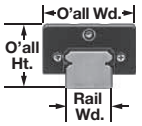
Corrosion-Resistant Ball Bearing Carriages and Guide Rails

Threaded-Hole Carriage and Guide Rail (Sold Separately)

Through-Hole Carriage and Guide Rail (Sold Separately)

Profile of Guide Rails with Carriage



Corrosion-Resistant Guide Rail, 5708K

Corrosion-Resistant Guide Rail, 9070T

Clean-Room Corrosion-Resistant Guide Rail

The stainless steel used to make these carriages and guide rails gives you excellent corrosion resistance. All carriages and guide rails can be mounted in any position. When wall mounted, however, corrosion-resistant threaded-hole carriages provide 84% of the dynamic load capacity listed below. All carriages have four mounting holes.

Threaded-hole carriages allow mounting from the top of your load into the carriage. ***Through-hole carriages*** allow mounting from the top of your load into the carriage as well as from the bottom of the carriage into your load.

Corrosion-Resistant Threaded-Hole Carriages— Made of Type 440C stainless steel and acetal, these carriages have lubricating end seals that are made of oil-impregnated polyolefin. All have Type 440C stainless steel ball bearings. Maximum temperature is 122° F.

Corrosion-Resistant Unthreaded Through-Hole Carriages— Made of 400 series stainless steel and resin with rubber end seals to keep lubricants in and dirt out. Ball bearings are 400 series stainless steel. Maximum temperature is 176° F.

Clean-Room Corrosion-Resistant Carriages— Suitable for clean room use, these carriages are made entirely of Type 440C and Type 304 stainless steel. End seals and end plates keep lubricants in and dirt out. Maximum temperature is 266° F.

Guide Rails— Made of hardened and ground 400 series stainless steel. *Clean-room corrosion-resistant guide rails* include mounting screws. **To Order:** For all rails, please specify length from the choices listed below. **Also Available:** Mounting hole plugs. For 5708K rails, please ask for 5708K1 and specify your rail's socket head cap screw size. For 9070T rails, please ask for 6709K9 and specify your rail's socket head cap screw size.

Note: Carriages can only be used with guide rails listed on the same line in the table.

Extra-Wide Ball Bearing Carriages and Guide Rails

With their added width and low-profile design, these carriages and guide rails have more stability to handle your off-center loads. Install them in any position without affecting load capacity. All of the carriages are made of steel with rubber end seals to keep lubricants in and dirt out. The ball bearings are steel. Maximum temperature is 176° F.

Threaded-hole carriages allow mounting from the top of your load into the carriage. ***Through-hole carriages*** allow mounting from the top of your load into the carriage as well as from the bottom of the carriage into your load.

Standard Carriages— Have six mounting holes, except 51 and 59 mm long threaded-hole carriages have four.

Extended-Life Carriages— Able to last twice as long as conventional carriages, these have an internal resin cage that separates the ball bearings to minimize noise, reduce heat buildup, and eliminate ball collisions to extend the life of the bearings. They have six mounting holes, except 59 mm long carriage has four.

Guide Rails— Made of hardened and ground steel. **To Order:** For all rails, please specify length from the choices listed below. For *standard rails*, you can also go to www.mcmaster.com and specify the part number listed below to see other available lengths. **Also Available:** Mounting hole plugs for all rails. Please ask for 6709K9 and specify your rail's socket head cap screw size.

Note: Carriages can only be used with guide rails listed on the same line in the table.

Miniature Ball Bearing Carriages and Guide Rails

When space is at a premium, these are the carriages and guide rails to choose. Install them in any position without affecting load capacity. All are made of corrosion-resistant stainless steel.

The carriages are threaded-hole carriages, which allow mounting from the top of your load into the carriage.

Standard Carriages— Made of Type 440C stainless steel. Rubber end seals and resin plates keep lubricants in and dirt out. All have stainless steel ball bearings. They also have four mounting holes, except 19 and 24.5 mm long carriages have two. Maximum temperature is 212° F, unless noted.

Clean Room Carriages— Suitable for clean room use, these carriages are made entirely of Types 440C and 304 stainless steel. End seals and plates keep lubricants in and dirt out. Carriages have four mounting holes, except 19 mm long carriage has two. Maximum temperature is 266° F.

Guide Rails— Made of hardened and ground Type 440C stainless steel. All include mounting screws. **To Order:** For rails, please specify length from the choices listed below.

Note: Carriages can only be used with guide rails listed on the same line in the table.

Ultra-Miniature Ball Bearing Carriages with Guide Rails

Small enough to fit on the tip of your finger, these tiny carriages and guide rails are sized for electronic and other precision applications. They come furnished as a complete unit (a carriage on a guide rail) and can be installed in any position without affecting load capacity. Maximum temperature is 212° F.

All carriages and guide rails are made of Type 440C stainless steel. The ball bearings are Type 440C stainless steel and are not retained, so they will fall out if the carriage is removed from the guide rail. The carriages and guide rails have two threaded through-holes for mounting, except 1 mm wide rails which do not have mounting holes on their guide rails.

Mounting Bracket— For use with 1 mm wide rails. Order a mounting bracket for each end of the rail.

Sleeve-Bearing Carriages and Guide Rails

Polyethylene Carriage and Guide Rail (Sold Separately)

Nylon-Lined Carriage and Guide Rail (Sold Separately)

Frelon-Lined Carriage and Guide Rail (Sold Separately)

PTFE-Lined Carriage and Guide Rail (Sold Separately)

Profile of Guide Rails with Carriage

Polyethylene Guide Rail | *Nylon-Lined Guide Rail* | *Frelon-Lined Guide Rail* | *PTFE-Lined Guide Rail*

The sleeve bearings in these carriages handle harsh conditions that ball bearings can't, such as dirt, water, impact, and vibration. All of the carriages and guide rails are made of corrosion-resistant materials. They do not require lubrication. Load capacity is diminished when blocks are mounted upside down, vertically, or on their side.

Threaded-hole carriages allow mounting from the top of your load into the carriage. ***Through-hole carriages*** allow mounting from the top of your load into the carriage as well as from the bottom of the carriage into your load.

Polyethylene Carriages and Guide Rails— Carriages are made of FDA- and USDA-compliant polyethylene for excellent chemical resistance. They have four threaded through-holes for mounting. Guide rails are ceramic-coated aluminum. Maximum temperature is 180° F.

Nylon-Lined Carriages and Guide Rails— Carriages are anodized aluminum and lined with bronze- and PTFE-impregnated nylon. They have four threaded holes for mounting. Guide rails are anodized aluminum. Maximum temperature is 175° F.

Frelon-Lined Carriages and Guide Rails— Carriages are anodized aluminum with a chemical-resistant Frelon liner (a PTFE-filled composite) for wear resistance and strength. They have four threaded through-holes for mounting. Guide rails are ceramic-coated anodized aluminum. Load capacity is for horizontal mounting only. Maximum temperature is 300° F.

PTFE-Lined Carriages and Guide Rails— Carriages are PTFE-lined anodized aluminum (except 15 mm wide rail with 315-lb. capacity is die cast zinc) for good abrasion resistance. All have four threaded through-holes for mounting. *Lockable carriages* also have a plastic knob on the side to lock them in place along the rail. Guide rails are anodized aluminum. Maximum temperature is 194° F.

To Order: For all rails, please specify length from the choices listed below.

Note: Carriages can only be used with guide rails listed on the same line in the table.

Low-Profile Sleeve-Bearing Carriages and Guide Rails

Snug mounting heights are no problem for these low-profile, low-maintenance carriages and guide rails. Use them for light to moderate loads, and frequent starting and stopping applications where tight tolerances are not required. Maximum temperature is 194° F.

Carriages— Made of chromated zinc (unless noted) with a PTFE liner for smooth, quiet operation. Their sleeve bearings handle harsh conditions that ball bearings can't, such as dirt, water, impact, and vibration. All are self-lubricating. 6723K9 and 6723K12 have two threaded holes, 6723K11 has two unthreaded through-holes, and 6723K13 has four threaded holes for mounting.

Guide Rails— Made of anodized aluminum. **To Order:** For rails, please specify length from the choices listed below.

Note: Carriages can only be used with guide rails listed on the same line in the table.

■ Guide block is plastic with brass mounting plate.

Extra-Wide Sleeve-Bearing Carriages and Guide Rails

With their added width and low-profile design, these carriages and guide rails have more stability to handle off-center loads. All are anodized aluminum and can be installed in any position without affecting load capacity. Maximum temperature is 194° F.

Carriages— These self-lubricating carriages have polymer sleeve bearings to handle harsh conditions that ball bearings can't, such as dirt, water, impact, and vibration. All have four threaded holes for mounting.

Guide Rails— **To Order:** For rails, please specify length from the choices listed below.

Note: Carriages can only be used with guide rails listed on the same line in the table.

Square Sleeve-Bearing Carriages and Guide Rails

No need for parallel shafts—the square design of these carriages and guide rails prevents unwanted rotation of loads. Install them in any position, but keep in mind the capacity listed is for loads directly centered on a carriage on any one of its sides. Maximum temperature is 400° F.

Carriages— Made of anodized aluminum alloy with self-lubricating Frelon-lined bearing plugs on all four sides, which you can adjust to maintain precise alignment. Frelon (a PTFE-filled composite) is chemical resistant and provides wear resistance and strength. The sleeve bearings in these carriages handle harsh conditions that ball bearings can't, such as dirt, water, impact, and vibration. All have threaded through-holes for mounting.

Guide Rails— Made of hollow Type 304 stainless steel with a 0.12″ wall thickness. **To Order:** For rails, please specify length: 2, 3, 4, or 6 ft.

Rail Supports— Made of cast aluminum. *End rail supports* have four 0.25″ dia. through-holes for mounting. *Mid rail supports* also have four through-holes for mounting (0.20″ dia. for 60255K34; 0.25″ dia. for 60255K35).

NEMA Motor-Mount Slides

Add your NEMA 17 or 23 motor and you're ready for precise linear motion. These highly rigid slides have a precision lead screw, ball bearing carriage, and shaft coupling already installed. Mount them horizontally and vertically.

Frame and carriage are aluminum. Lead screw is Type 303 stainless steel. Guide rails are hardened steel. Base has M5 Dia. through-holes with a 9 mm Dia. × 5.5 mm Dp. counterbore for mounting. Straightness accuracy is 0.0002″ per inch of travel. Maximum motor input is 2,000 rpm. Maximum temperature is 180° F. **To Order:** Please specify screw lead (the distance a load moves with one revolution of the lead screw): 0.125″, 0.25″, 0.5″, or 1″.

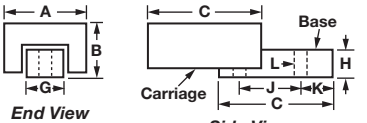
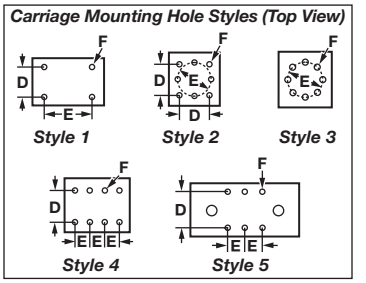
Low-Friction Slides

Low Profile



Standard Height



Excellent for short-travel, high-speed applications where low-friction performance is a must. Slides have a lightweight, corrosion-resistant aluminum carriage with threaded holes and a base with counterbored holes for socket head cap screws (unless noted). Carriage and base are the same length; to achieve travel, carriage must move beyond the base. Capacities listed are for horizontal mounting. If side mounted, load capacity is cut in half.

Ball Bearing Style Slides— A row of ball bearings on each side of the base provides high-precision linear motion. Bearings are caged in a retainer, which eliminates ball collisions to extend service life.

Choose *low-profile slides* for limited-space applications. Raceway rods and balls are steel. Straightness accuracy is 0.0005″ per inch of travel. Maximum temperature is 180° F.

Standard-height slides have raceway rods and balls that are made of Type 440C stainless steel. Straightness accuracy is 0.00008″ per inch of travel. Maximum temperature is 150° F.

High-Load Cylindrical-Roller Bearing Style Slides— Compared with similar-sized ball bearing slides, these offer higher load capacities. The cylindrical roller design lets the slides handle forces in any direction, so they're good for sudden loads and overhanging loads. Rollers ride on a pair of rails on each side of the base. Rollers and rails are hardened steel with stainless steel end caps. Straightness accuracy is 0.0001″ per inch of travel. Maximum temperature is 220° F.

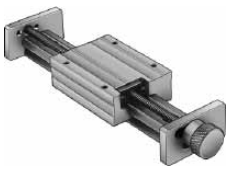
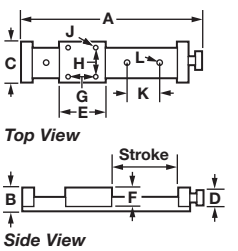
★ Threaded through holes. ◆ Has 10 mounting holes.

High-Capacity Manual-Position Slides





To handle high loads, these slides have an aluminum carriage lined with Frelon (a PTFE-filled composite). They also have a Type 303 stainless steel precision lead screw, which makes them good for manual-positioning applications. Lead screws are accurate to 0.0006″ per inch of travel. Screw lead (the distance a load moves with one revolution of the screw) is 0.05″. Maximum temperature is 300° F.

All of these slides have self-lubricated sleeve bearings to move smoothly, even in dirty environments. End blocks are aluminum. Carriages have four threaded holes. Depending on length, rails for 499-lb. capacity slides have 4, 8, or 12 counterbored unthreaded holes centered on the rail with an M3 cap screw size. Rails for 800-lb. capacity slides have 3, 5, or 8 counterbored unthreaded holes centered on the rail with an M5 cap screw size. For horizontal mounting.

X-Y plates let you mount a second slide for motion in two directions. They have four counterbored through holes (cap screw size is M3 for 9222T41; M4 for 9222T42).

Manual-Position Slides

A precision lead screw allows you to use these slides in a variety of manual-positioning applications for laboratory and production equipment as well as for positioning parts in drilling, fastening, assembly, and gauging jobs. The lead screw is Type 303 stainless steel for 15- and 30-lb. capacity models; nickel-plated steel for 100-lb. capacity models. Screw lead (the distance a load moves with one revolution of the screw) is listed in the table.

All of these slides have Rulon-lined sleeve bearings to move smoothly, even in dirty environments. The carriages and bases are made of aluminum. Carriages have four threaded mounting holes. Bases have two or more countersunk mounting holes for flat head screws. Capacities listed are for horizontal mounting. When mounted vertically, the load capacity is cut in half. Maximum temperature is 180° F.

Precision Slides— Lead screws are accurate to 0.007″ per 10 inches of travel.

Ultra-Precision Slides— Have a micrometer-like position readout (to 0.001″) for measuring travel distance. They also have linear scales with 0.025″ divisions and index pointers. Lead screws are accurate to 0.0015″ per 10 inches of travel.

High-Speed Needle-Roller Bearing Carriages and Guide Rails

The needle-roller bearings inside these carriages give you smooth operation at faster speeds than ball bearing and track roller carriages. Rollers are made of steel and are permanently lubricated, saving maintenance time and effort. Install these carriages and guide rails in any position without affecting load capacity. Maximum temperature is 176° F.

Carriages— Made of aluminum with nylon end caps. All have four threaded through-holes for mounting.

Lockable carriages also have a side handle to lock them in place along the rail. Clamping force is 44 lbs. for 9881K22, 56 lbs. for 9881K33, and 78 lbs. for 9881K44.

Guide Rails— Made of anodized aluminum with hardened and ground steel inserts. The rollers ride on the inserts. **To Order:** For rails, please specify length from the choices listed below.

Note: Carriages can only be used with guide rails listed on the same line in the table.

Track Roller Carriages and Guide Rails

Suitable for dirty environments, these lightweight, easy-to-install carriages have four external V-groove track rollers that are lubricated and sealed for life. They are also extra wide for greater rigidity and load capacity. Install these carriages and guide rails in any position without affecting load capacity. Maximum temperature is 158° F.

Carriages— Made of aluminum with steel rollers. All have six threaded through-holes for mounting.

Guide Rails— Made of hardened steel. **To Order:** For rails, please specify length from the choices listed below.

Note: Carriages can only be used with guide rails listed on the same line in the table.

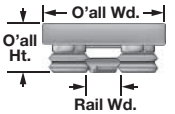
Miniature Track Roller Carriages and Guide Rails

Steel-Wheel Carriage and Guide Rail (Sold Separately)



Sized just right for electronic and packaging applications, these compact carriages and guide rails have V-groove wheels and a double-edged track for smooth, precise movement. Install these carriages and guide rails in any position without affecting load capacity. Maximum temperature is 248° F.

Carriages— Made of anodized aluminum, these carriages come lubricated and have two adjustment screws that allow you to tighten or loosen snugness on the rail. All have four threaded mounting holes. *Steel wheels* allow for a higher load capacity. *Polymer wheels* are lightweight and suitable for corrosive environments.

Guide Rails— Made of carbon steel. ***Support rails*** (sold separately) are required for carriage clearance. Order one per guide rail.

To Order: For guide rails and support rails, please specify length: 6.5″ (has 4 mounting holes), 12.5″ (has 7 mounting holes), 18.5″ (has 10 mounting holes), 24.5″ (has 13 mounting holes), 30.5″ (has 16 mounting holes), or 36.5″ (has 19 mounting holes).

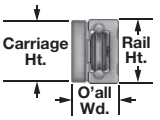
Side-Mount Track Roller Carriages and Guide Rails

Carriage and Guide Rail (Sold Separately)



Lightweight and easy-to-install for applications that require side mounting. These carriages and guide rails have three internal track rollers for fast speeds and quiet operation. Their enclosed track design keeps out large debris, plus they can generally sustain greater loads than standard track-roller systems. Maximum temperature is 180° F.

All of the carriages are aluminum and have two threaded through-holes for mounting. The rails are aluminum with hardened and ground steel raceways. *Metric carriages* also have end caps with oil-impregnated plastic wipes that slide along the rail to sweep away contaminants. Carriages allow you to adjust how snug the roller fits to the rail.

To Order: For all rails, please specify length from the choices listed below.

Note: Carriages can only be used with guide rails listed on the same line in the table.

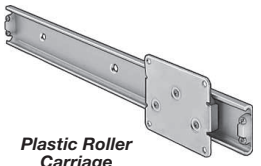
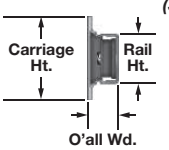
Light Duty Side-Mount Carriages and Guide Rails



Plastic Roller Carriage and Guide Rail (Sold Separately)

Stainless Steel Ball Bearing Carriage and Guide Rail (Sold Separately)



Use these carriages and guide rails for light-load linear motion where tight tolerances aren't required. All are designed for side mounting. Maximum temperature is 176° F.

Carriage with Plastic Rollers— Made of steel with plastic rollers, this carriage offers a low-cost alternative to ball bearing carriages for light duty applications. It has four unthreaded through-holes for mounting. Rails are aluminum.

Carriages with Stainless Steel Ball Bearings— Carriages have two rows of recirculating, Type 440C stainless steel ball bearings. Steel retainers keep balls in when carriages are removed from the rails. Synthetic rubber end seals keep lubricants in and dirt out. All carriages have four threaded through-holes for mounting. Rails are Type 304 stainless steel. Use the optional *connector plates* to mount rails end to end for greater travel.

To Order: For all rails, please specify length from the choices listed below.

Note: Carriages can only be used with guide rails listed on the same line in the table.

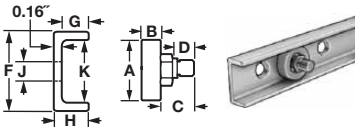
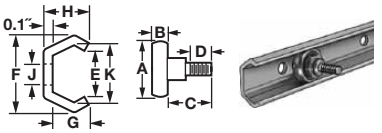
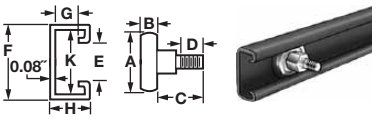
Side-Mount Track Rollers and Guide Rails



Polymer Roller and Aluminum Rail (Sold Separately)



Stainless Steel Roller and Rail (Sold Separately)



Steel Roller and Rail (Sold Separately)

Just like on your garage door, these stud-mount rollers ride on a rail. They can be loaded for a snug or loose fit in the rail.

Polymer Rollers and Aluminum Rail— These economical rollers are polymer with Type 440C stainless steel shielded ball bearings. Rails are anodized aluminum. Maximum temperature is 158° F. The *6-lb. capacity rollers* have an M6 threaded stud; *12-lb. capacity rollers* have an M8 threaded stud.

Stainless Steel Roller and Rail— Offering excellent corrosion resistance, the roller is Type 440 stainless steel with double-sealed Type 440 stainless steel ball bearings. Roller has an M5 threaded stud. The rail is Type 316 stainless steel and can be cut to size. Maximum temperature is 212° F.

Steel Roller and Rail— This high-capacity roller is steel with double-sealed steel ball bearings. It has a 5/16"-18 threaded stud. The rail is powder-coated steel and can be cut to size. Maximum temperature is 176° F. Mount rail by drilling holes or use the *optional L-angle mounting bracket*, which is 1 9/32" Lg. × 1 1/2" Wd. × 0.120" Thick. To install, weld bracket to back of rail. *Optional end stop* prevents overtravel of rollers but is not designed to support loads.

To Order: For all rails, please specify length from 1 to 8 ft. in 1-ft. increments.

Note: Track rollers can only be used with guide rails listed on the same line in the table.

Telescopic Slides

Allowing motion beyond your mounting surface, these slides are great for pick-and-place automated applications, machine tool doors, and telescopic industrial press arms. They function similarly to drawer slides, but they're more rugged and support heavier loads. Use them where tight tolerances are not required.

Slides are hardened zinc-plated steel with threaded through-holes. Ball bearings and rails are hardened steel. The rails accept flat head screws. Load capacities listed are for side mounting. If mounted horizontally or upside down, load capacity is 70% of the capacity listed. Not recommended for vertical mounting. Maximum temperature is 338° F.

Roller Bearing Slide Sets

Get low-profile, space-saving linear motion with these slide sets. A set includes four rails, two roller bearing cage slides, and eight end stops. Maximum temperature is 176° F.

Rollers are made of steel and are retained in a plastic cage. Rails are made of precision ground and hardened steel and have threaded and counterbored holes for easy mounting with socket head cap screws. Mount in any position without affecting load capacity.

Linear Bearings for T-Slotted Framing

Here's a versatile solution to guided linear motion applications that don't require high precision. *Note:* For structural hardware and accessories, see pages 1942-1949.

***Sleeve-Bearing Carriages*—** Suitable for washdown applications, these carriages have an anodized aluminum shell that's lined with an extra-tough UHMW (ultra-high molecular weight) polyethylene bearing pad for inch sizes; acetal bearing pad for metric sizes. The pads are self-lubricating and USDA approved. All of these carriages are designed for horizontal mounting. Maximum temperature is 180° F.

High-strength sleeve-bearing carriages have threaded inserts that secure the bearing pad lining to the outer shell. They're the choice for jobs with frequent starting and stopping. They're also good for pick and place, parts transfer, and other high-speed applications.

***Track Roller Carriages*—** Made of aluminum with nylon rollers and permanently lubricated plain bronze bearings. You can use several of these carriages on a rail at once. Mount so wheels are positioned vertically. Two T-nut fasteners and two socket head cap screws are included. Maximum temperature is 150° F.

***T-Slotted Guide Rails*—** Made of anodized aluminum, rails can be easily cut to length and drilled for mounting.

Optional hand brakes mount on the carriages to hold them in place on the rail. Standard sleeve-bearing carriages have a mounting hole for the brakes. High-strength sleeve-bearing carriages require you to drill a mounting hole for the brake.

Optional end caps mount on the rails to prevent overtravel.

T-slot fasteners (sold separately) let you mount components to the carriages.

About Precision Acme Threaded Rods

Count on precision Acme threaded rods to simply and effectively convert rotary motion into smooth, precise linear motion. Although not as efficient as ball screws, they're more economical and are great for handling jobs with lower speeds and fewer cycles.

Precision Acme threads are broader, stronger, and more square than standard V-shaped threads, which means they're better suited for carrying loads. They have a 2C (self-centering; tight and precise) thread fit and a smooth finish that increases rod life by reducing friction. Lower-precision general purpose Acme threaded rods have a 2G (general) thread fit. The 2C and 2G thread fits are compatible, but when used together you will lose the precision of the 2C thread fit.

Acme Size— Indicates the diameter of the rod and the number of threads per inch. For example, a rod with an Acme size of ½″-8 has a diameter of ½″ with 8 threads per inch.

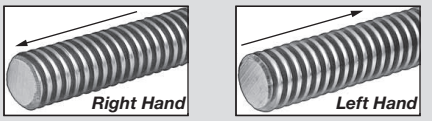
Travel Distance per Turn— The distance a nut will travel with one revolution of the threaded rod. Accuracy for travel distance per turn is 0.009″ or better per foot.

Standard- and ***Fast-Travel Rods—*** The number of individual threads on a rod determines how fast a nut will travel on the rod. Our ***standard-travel rods*** (also known as single-start rods) are the most common rods and have a single thread that runs the length of the rod. Our ***fast-travel rods*** (also known as multiple-start rods) have multiple threads that run the length of the rod. Standard-travel rods must be used with standard-travel nuts and fast-travel rods must be used with fast-travel nuts.

Speed Ratio— Indicates how fast a nut will travel on the threaded rod. The first number in the speed ratio corresponds to the number of starts for that rod or nut. Compared to standard-travel rods, fast-travel rods provide more travel (speed) for each turn of the rod. For example:

Acme Size and Style of Rod	Speed Ratio	Travel Distance per Turn	Travel Distance per 100 Turns
¾″-8 Standard Travel	1:1	⅛″	12½″
¾″-8 Fast Travel	2:1	¼″	25″
¾″-8 Fast Travel	4:1	½″	50″

Right-Hand and Left-Hand Threads



Turn the threaded rods clockwise and your nuts will travel in the direction shown. *Note:* Right-hand threads are the most common threads.

Standard-Travel Precision Acme Threaded Rods

The workhorse of precision Acme threaded rod, these standard-travel (single-start) rods have a 1:1 speed ratio. Accuracy for travel distance per turn is 0.009″ or better per foot. Use with standard-travel nuts that have the same Acme size. For nuts, see the following page.

1018 Carbon Steel— Minimum tensile strength is 64,000 psi. Hardness is 126-180 Brinell. ***Heat-Treated 4140 Alloy Steel—*** Harder than 1018 carbon steel, these rods ensure greater strength and durability. Minimum tensile strength is 125,000 psi. Hardness is 271 Brinell. All have a black-oxide finish. ***Type 304 Stainless Steel—*** The choice for corrosion resistance. Minimum tensile strength is 72,000 psi. Hardness is 150-220 Brinell.

Precision Acme Threaded Rods

To Order: Please specify 3-ft. or 6-ft. lengths (except for Acme size ¼″-16 and ¼″-20 Type 304 Stainless Steel rods, which are only available in 6-ft. lengths).

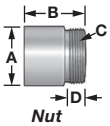
Standard-Travel Precision Acme Round Nuts and Mounting Flanges



Nut

Mounting Flange

Assembled Nut and Mounting Flange

Use these standard-travel (single-start) nuts and mounting flanges with the Standard-Travel Precision Acme Threaded Rods on the previous page. Use rods that have the same Acme size. Speed ratio is 1:1.

Bronze nuts and ***steel mounting flanges*** are good for most applications. ***Plastic nuts*** and ***Type 303 stainless steel mounting flanges*** offer corrosion resistance.

Bronze Nuts—Hardness is 70-126 Brinell. ***Plastic Nuts—***Made of FDA-compliant polyethylene terephthalate (PET).

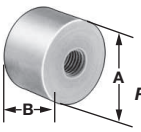
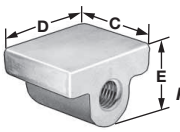
Standard-Travel Machinable Precision Acme Nuts



Round Nut



Platform Nut

Use these standard-travel (single-start) machinable nuts with the Standard-Travel Precision Acme Threaded Rods on the previous page. Use rods that have the same Acme size. Speed ratio is 1:1. **To Order:** Please specify right- or left-hand threads (except for 1343K39, 1343K23, 1349K39, and 1349K23 which are right-hand thread only).

Round nuts have a large OD so you can machine them to your own specifications. ***Platform nuts*** have a platform that allows you to drill your own mounting holes for mounting flexibility.

Cast Iron—Hardness is 217-269 Brinell. ***660 and 932 Bronze—***Hardness is 65 Brinell. ***Plastic—***Corrosion resistant. Made of FDA-compliant polyethylene terephthalate (PET).

For information about precision Acme threaded rods, see page 1155.

Fast-Travel Precision Acme Threaded Rods

Multiple threads run the length of these fast-travel (multiple-start) rods, which means your nut will travel faster with each turn than on standard-travel (single-start) rods. Accuracy for travel distance per turn is 0.009″ or better per foot. Use with fast-travel nuts that have the same Acme size and speed ratio. **To Order:** Please specify 3-ft. or 6-ft. lengths (except for Type 304 stainless steel, which are only available in 6-ft. lengths).

***1018 Carbon Steel*—**Minimum tensile strength is 64,000 psi. Hardness is 126-150 Brinell. ***Heat-Treated 4140 Alloy Steel*—**Harder than 1018 carbon steel, these rods ensure greater strength and durability. Minimum tensile strength is 125,000 psi. Hardness is 271 Brinell. All have a black-oxide finish. ***Type 304 Stainless Steel*—**The choice for corrosion resistance. Minimum tensile strength is 72,000 psi. Hardness is 150-220 Brinell.

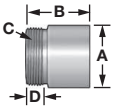
Fast-Travel Precision Acme Round Nuts



Use these fast-travel (multiple-start) nuts with the Fast-Travel Precision Acme Threaded Rods on this page and the mounting flanges (see 95082A and 1329K) on the previous page. Use rods that have the same Acme size and speed ratio.

***Bronze Nuts*—**Good for most applications. Hardness is 70 to 126 Brinell. ***Plastic Nuts*—**Made of FDA-compliant polyethylene terephthalate (PET).

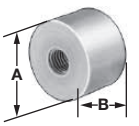
Fast-Travel Machinable Precision Acme Round Nuts



Use these fast-travel (multiple-start) machinable nuts with the Fast-Travel Precision Acme Threaded Rods on this page. All have a large OD so you can machine them to your own specifications. Use rods that have the same Acme size and speed ratio. **To Order:** Please specify right- or left-hand threads, unless noted.

***Cast Iron*—**Hardness is 217 to 269 Brinell. ***660 Bronze*—**Hardness is 65 Brinell. ***Plastic*—**Corrosion resistant. Made of FDA-compliant polyethylene terephthalate (PET).

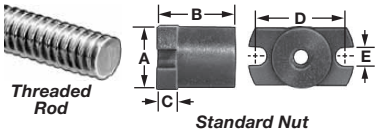
★Available with right-hand threads only.

Acme Threaded Rod Lubricant

Maximize the life of your threaded rods with this synthetic, corrosion-resistant lubricant. Operating temperature range is –10° to +400° F.

14.1-oz. Can ..... 1378K34 **Each** $11.55

Miniature Corrosion-Resistant Precision Threaded Rods and Nuts



Perfect for moving small loads in confined spaces, these rods and nuts are corrosion resistant and have right-hand threads. They're similar to, but not compatible with, precision Acme threaded rods and nuts. ***Fast-travel (multiple-start) rods*** have multiple threads that run the length of the rods, which means your nut will travel faster with each turn than on standard-travel (single-start) rods.

Threaded Rods— Made of Type 303 stainless steel, all are 18″ long. Accuracy for travel distance per turn is 0.0006″ per inch. Minimum tensile strength is 90,000 psi. Hardness is 160 Brinell.

Nuts— All are made of polyacetal and are self-lubricating. *Wear-compensating nuts* have an internal O-ring that maintains a tight thread fit even when threads begin to wear.

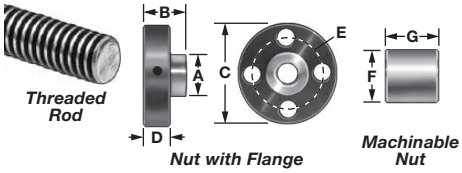
Metric Standard-Travel Precision Threaded Rods and Nuts



Made to DIN 103 standards, these rods and nuts (also known as trapezoidal thread form) offer the advantages of precision Acme threaded rods and nuts but in metric sizes. All are standard travel (single start) and have right-hand threads. Speed ratio is 1:1.

Threaded Rods— Made of 1018 carbon steel, these rods are 1,750 mm long. Accuracy for travel distance per turn is ±0.15 mm per 300 mm. Minimum tensile strength is 70,000 psi. Hardness is 150-180 Brinell.

Nuts with Flange— Nuts are bronze; flanges are steel. Nut hardness is 126 Brinell; flange hardness is 150-180 Brinell. Flange mounting holes are 0.266″ dia., unless noted.

Machinable Nuts— Bronze with oversized OD for machining. Hardness is 70 Brinell.

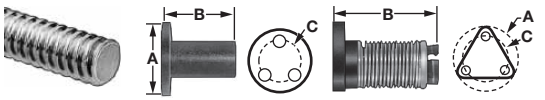
♦ Flange mount hole diameter is 0.397″.

Ultra-Smooth Corrosion-Resistant Threaded Rods and Nuts



Similar to, but not compatible with, precision Acme threaded rods and nuts, these rods and nuts have smoother and rounder thread edges for increased nut life and ultra-smooth travel. All are corrosion resistant and have right-hand threads. ***Fast-travel (multiple-start) rods*** have multiple threads that run the length of the rods, which means your nut will travel faster with each turn than on standard-travel (single-start) rods.

Threaded Rods— Made of Type 303 stainless steel, these rods are 6 feet long. Accuracy for travel distance per turn is ±0.0006″ per inch. Minimum tensile strength is 90,000 psi. Hardness is 160 Brinell. ***Nuts—*** All are polyacetal and self-lubricating. They have a flange with 0.2″ dia. mounting holes, unless noted. Minimum tensile strength is 9,700 psi. *Wear-compensating nuts* have a spring that maintains a tight fit even when threads begin to wear.

About Ball Screws and Ball Nuts

A ball nut contains ball bearings that circulate in the groove of a ball screw to reduce friction between the nut and the screw. Together they provide smooth, precise positioning control over the full length of the ball screw. They also convert rotary motion to linear motion more efficiently than precision Acme threaded rods. *Note:* Ball nuts are furnished with a cardboard tube to keep ball bearings in place. Do not remove the tube until you are ready to install the nuts onto the screws.

Travel Distance per Turn—Also known as screw lead, travel distance per turn is the distance a ball nut moves with one revolution of the ball screw. For proper fit, choose ball nuts with the same diameter and travel distance per turn as the ball screw.

Interior View of a Ball Nut on a Ball Screw

Ball Screws, Ball Nuts, and End Mounting Blocks

Ball Screws and End Mounting Blocks

Ball Screws—All are made of hardened alloy steel. They have right-hand rolled threads. Accuracy for travel distance per turn is ±0.004″ per foot. Rockwell hardness is C56. Temperature range is –65° to +300°F with a high-temperature lubricant. For use with ball nuts that have the same screw diameter and travel distance per turn. **To Order:** Please specify screw length in whole feet up to the maximum length listed.

End Mounting Blocks—Support ball screws (sold separately) to help eliminate wobble. Made of steel, each includes bearings, replaceable seals, a locknut, and a washer. Use one end mounting block for a floating setup or two end mounting blocks for a rigid setup. *Note:* The end of your ball screw must be machined before installing it into an end mounting block.

Ball Screws with One Machined End and End Mounting Blocks

Ball Screws with One Machined End—Identical to the ball screws above, except these have one end that has already been machined for you. The machined end fits perfectly into an end mounting block (sold separately) and is ready to connect to your motor. It has a standard Type III journal with drive extension. To adjust the length, the non-machined end can be cut to size.

End Mounting Blocks—For information and illustration, see above.

Ball Nuts and Ball Nuts with Flange

All of these ball nuts are made of heat-treated alloy steel with a black-oxide finish. The maximum play between the screw and the nut is 0.015″. Rockwell hardness is C56. Temperature range is –65° to +300°F.

For use with ball screws that have the same screw diameter and travel distance per turn. Load capacities are based on using a ball screw and a ball nut together.

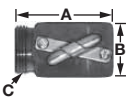
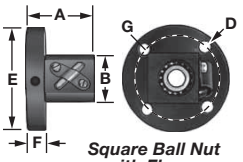
Corrosion-Resistant Ball Screws and Ball Nuts

Ball Screw



Round Ball Nut



Square Ball Nut with Flange

Suitable for use in harsh environments, all of these ball screws and ball nuts are Type 17-4 PH stainless steel. Rockwell hardness is C38. Temperature range is –30° to +180° F. Use ball screws and ball nuts with the same screw diameter and travel distance per turn. Flange (where applicable) is 300 series stainless steel.

Ball Screws—Have right-hand rolled threads. Accuracy for travel distance per turn is ±0.004″ per foot. They can be used with the steel end mounting blocks, which are sold on page 1159. *Note:* The end of your ball screw must be machined before installing it into an end mounting block.

Ball Nuts—The maximum play between the screw and the nut is 0.007″.

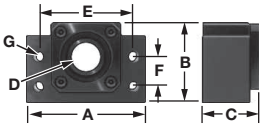
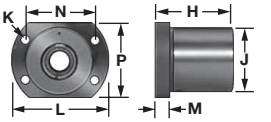
Metric Ball Screws, Ball Nuts, and End Mounting Blocks

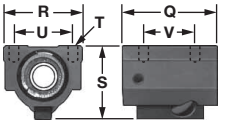
Ball Screw



End Mounting Block



Ball Nut with Flange



Platform Ball Nut

Ball Screws—All are AISI 1055 alloy steel and have right-hand rolled threads. Accuracy for travel distance per turn is 0.210 mm per 300 mm. Rockwell hardness is C58-C64. Temp. range is 5° to 176° F. For use with ball nuts that have the same screw diameter and travel distance per turn.

End Mounting Blocks—Support ball screws (sold separately) to help eliminate wobble. Made of steel, each includes bearings, seals, and a locknut. Use one end mounting block for a floating setup or two end mounting blocks for a rigid setup. *Note:* The end of your ball screw must be machined before installing it into an end mounting block.

Ball Nuts—All are steel. Maximum play between screw and nut is 0.1 mm. Rockwell hardness is C58-C64. Temp. range is 5° to 176° F. For use with ball screws that have the same screw diameter and travel distance per turn.

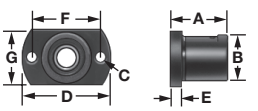
Miniature Metric Ball Screws with Ball Nut

Ball Screw w/Included Ball Nut



Ball Nut

We've paired a ball screw and a ball nut, which have a small overall size and tiny travel distance per turn to tackle your miniature applications. Accuracy for travel distance per turn is 0.210 mm per 300 mm. Rockwell hardness is C58-C64. Temperature range is 5° to 176° F.

The ball screw is AISI 1055 alloy steel and has right-hand rolled threads. The ball nut is JIS G 4052 steel and has a flange. The maximum play between the screw and the nut is 0.05 mm.

Screw Dia., mm	Travel Distance per Turn, mm	Load Cap., lbs.	Screw Lg., mm	(A), mm	Dia. (B), mm	Dia. (C), mm	(D), mm	(E), mm	Ctr.-to-Ctr. (F), mm	(G), mm		Each

Screw Jacks

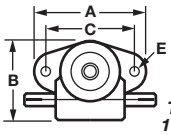
Designed to convert rotary motion into linear motion, screw jacks are excellent for lifting, holding, positioning, and leveling loads. They have a worm gear for precise movement. Furnished assembled and threaded, they are ready for installation and motor hookup. Simply attach your motor shaft to the screw jack shaft. The screw jack shaft has a keyway at both ends (for shaft diameter and keyway dimensions, see below).

Mount these jacks vertically or horizontally. ***Upright style*** and ***inverted style*** refer to the mounting flange location in relation to the lift screw.

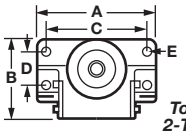
Travel Distance per Turn— Also known as screw lead, travel distance per turn is the distance a load is moved with one revolution of the lift screw.

Optional Mounting Attachments— Thread directly onto the jacks.

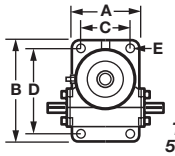
Acme Screw Jacks



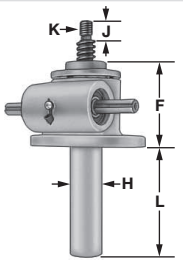
Top View, 1-Ton Jack



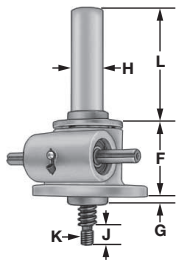
Top View, 2-Ton Jack



Top View, 5-Ton Jack



Upright Style



Inverted Style

All jacks have a cold-rolled alloy steel lift screw. Accuracy for travel distance per turn is 0.010″ per foot. Maximum temperature is 250° F.

The ***1-ton jacks*** have sealed ball bearings and an aluminum alloy housing. Gear ratio is 5:1. The ***2-*** and ***5-ton jacks*** have tapered roller bearings and a ductile iron housing. Gear ratio is 6:1.

To Order: Please specify travel length in whole inches up to the maximum length listed. To determine your price, multiply the travel length per inch price by the number of inches you need, then add that to the base price of the jack.

Compact Screw Jacks

The choice for tight spots. **To Order:** Please specify travel length from those available below.

Compact Acme Screw Jacks— Housing is aluminum. Lift screw is 11L17 steel for 250-lb. jacks; Type 304 stainless steel for 500- and 1,000-lb. jacks. Accuracy for travel distance per turn is 0.010″ per foot. Gear ratio is 5:1. Max. temp. is 250° F.

Jacks with mounting plate have a 2 1/4″ Dia.×5/16″ Thick. plate with four 9/32″ dia. mounting holes (1 1/2″ center-to-center).

Compact Ball Screw Jacks— You'll get higher efficiency, longer duty cycles, and faster lifting speeds with half the power needed for Acme screw jacks. Housing is ductile iron. Lift screw is heat-treated steel. Accuracy for travel distance per turn is 0.044″ per foot. Gear ratio is 6:1. Max. temp. is 120° F.

About Track Rollers

Also known as cam followers, track rollers have a thick outer roller that runs directly on a flat surface.

Roller Style

Threaded—Thread the stud directly into a component or secure with a nut for through-hole mounting.

Shaft Mount—Also known as yoke-style cam followers, these rollers have more mounting flexibility than threaded track rollers. They're typically mounted onto a shaft or clevis rod end.

Roller Profile

Flat—The choice for perfectly flat surfaces, these rollers offer the best surface-to-surface contact.

Crowned—Have a slight curve, which is invisible to the naked eye, to stay centered on surfaces that are not perfectly aligned and/or not perfectly flat.

Load Direction and Load Capacity

Radial load refers to the force that is applied perpendicular to the roller's outer surface.

Thrust load, also known as axial load, refers to the force that is applied parallel to the end of the roller.

Static load capacity is the weight a roller can support while stationary.

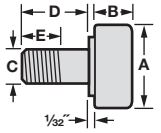
Dynamic load capacity is the weight a roller can support while in motion.

Lubrication Port Locations

Most threaded track rollers have a lubrication hole in the side of the stud (access can be difficult once rollers are installed). Others allow lubrication through the end of the stud and head of the roller. Lubrication holes in all three points allow maximum access.

Shaft-mount track rollers usually have a lubrication hole or groove in the roller's inner ring.

Threaded Track Rollers



Also known as cam followers, track rollers support loads while guiding and positioning work. Lubrication holes are in the end and the side of the stud, unless noted. All are steel with a black-oxide finish. They have needle roller bearings and a hex socket head. Mounting nut not included. Maximum temperature is 250° F.

Crowned rollers have a slight curve, which is invisible to the naked eye, to stay centered on surfaces that are not perfectly aligned and/or not perfectly flat.

Sealed rollers have end seals to protect rolling elements from dirt and contamination.

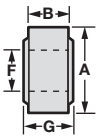
★No lubrication holes.

Shaft-Mount Track Rollers



Also known as yoke-style cam followers, these rollers have more mounting flexibility than threaded track rollers. Lubricate rollers through a hole and groove in the inner ring. All are steel with a black-oxide finish and have needle roller bearings. Maximum temperature is 250° F.

Crowned rollers have a slight curve, which is invisible to the naked eye, to stay centered on surfaces that are not perfectly aligned and/or not perfectly flat.

Sealed rollers have end seals to protect rolling elements from dirt and contamination.

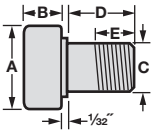
Threaded Track Rollers with Oversized Stud



An oversized stud roughly doubles the static load capacity of these rollers. Also known as cam followers, track rollers support loads while guiding and positioning work. Lubrication holes are in the side of the stud, unless noted. All are steel with a black-oxide finish. They have needle roller bearings and a hex socket head. Mounting nut not included. Maximum temperature is 250° F.

Crowned rollers have a slight curve, which is invisible to the naked eye, to stay centered on surfaces that are not perfectly aligned and/or not perfectly flat.

Sealed rollers have end seals to protect rolling elements from dirt and contamination.

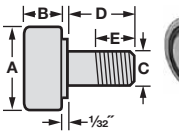
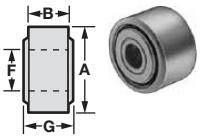
Ultra Corrosion-Resistant Track Rollers



Threaded



Shaft Mount

Made of 440C stainless steel, these track rollers offer excellent corrosion resistance. Also known as cam followers, track rollers support loads while guiding and positioning work. All rollers have end seals to protect rolling elements from dirt and contamination. They have needle roller bearings. Maximum temperature is 250° F.

Threaded—Lubrication holes are in the end and the side of the stud, unless noted. All have a hex socket head. Mounting nut not included.

Shaft Mount—Lubricate rollers through a hole and groove in the inner ring.

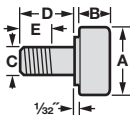
Threaded Track Rollers with Three Lubrication Ports



Lubricate these track rollers through their hex socket head when access to the stud is limited. They also have lubrication holes in the side and end of the stud for maximum access. Also known as cam followers, track rollers support loads while guiding and positioning work. All are steel and have end seals to protect rolling elements from dirt and contamination. They have needle roller bearings and a hex socket head. Mounting nut is included. Maximum temperature is 250° F.

Crowned rollers have a slight curve, which is invisible to the naked eye, to stay centered on surfaces that are not perfectly aligned and/or not perfectly flat.

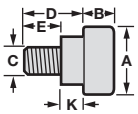
Threaded Track Rollers with Adjustable Shoulder



Also known as eccentric track rollers, the shoulder adjusts up or down up to 0.03" (0.015" on 3/4" and 7/8" dia. rollers) to align to your track, enabling uniform alignment among rollers in a system. Lubricate these rollers through the roller head. All are steel and have end seals to protect rolling elements from dirt and contamination. They have needle roller bearings and a hex socket head. Mounting nut is included. Maximum temperature is 250° F.

Crowned rollers have a slight curve, which is invisible to the naked eye, to stay centered on surfaces that are not perfectly aligned and/or not perfectly flat.

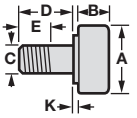
Metric Threaded Track Rollers



Also known as cam followers, track rollers support loads while guiding and positioning work. They have one lubrication hole in the head, unless noted. All are steel. They have needle roller bearings and a hex socket head. Mounting nut is included.

Sealed rollers have end seals to protect rolling elements from dirt and contamination.

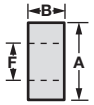
★No lubrication holes. ■ Max. temp. is 175° F. ♣ Lubrication holes in head as well as the end and side of the stud.

High-Speed Shaft-Mount Track Rollers



The outer ring is built to handle higher speeds than standard shaft-mount track rollers. Lubrication is required. All are steel and have needle roller bearings. Maximum temperature is 250° F.

Sealed rollers have end seals to protect rolling elements from dirt and contamination.

High-Load Track Rollers

With a double row of cylindrical roller bearings, these rollers provide the highest combination of speed and dynamic radial load ratings of any track roller we offer. Also known as cam followers, track rollers support loads while guiding and positioning work. All rollers are permanently lubricated and have end seals to retain lubricant and protect rolling elements from dirt and contamination. All are steel. Maximum temperature is 250° F.

Threaded rollers have a hex socket head. Mounting nut is included.

Metric Maintenance-Free Threaded Track Rollers

Because they never need to be relubricated, these rollers are a good choice for hard-to-reach places. Also known as cam followers, track rollers support loads while guiding and positioning work. These crowned rollers have a slight curve, which is invisible to the naked eye, to stay centered on surfaces that are not perfectly aligned and/or not perfectly flat. They have end seals to block dirt and contamination. All are steel and have needle roller bearings and a hex socket head. Mounting nut is included. Maximum temperature is 175° F.

Thrust-Load-Rated Threaded Track Rollers

These rollers are rated to handle radial and thrust (top and side) loads simultaneously. Also known as cam followers, track rollers support loads while guiding and positioning work. All are permanently lubricated and have end seals to retain lubricant and protect rolling elements from dirt and contamination. Maximum temperature is 225° F, unless noted.

Threaded rollers have a hex socket in the stud end. They have ball bearings, unless noted. Mounting nut is included.

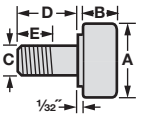
Corrosion-Resistant Threaded Track Rollers



These chrome-plated steel rollers offer good corrosion resistance without the expense of stainless steel. Also known as cam followers, track rollers support loads while guiding and positioning work. All rollers have end seals to protect rolling elements from dirt and contamination. Lubrication holes are in the side and end of the stud, unless noted. They have needle roller bearings and a hex socket head. Mounting nut not included. Maximum temperature is 250° F.

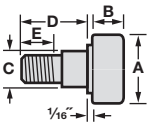
Miniature Thrust-Load-Rated Corrosion-Resistant Threaded Track Rollers



Made of 303 stainless steel, these tiny rollers offer excellent corrosion resistance. They are rated to handle radial and thrust (top and side) loads simultaneously. Also known as cam followers, track rollers support loads while guiding and positioning work. All rollers are permanently lubricated and have end seals to retain lubricant and protect rolling elements from dirt and contamination. They have ball bearings and a slotted head. Mounting nut is included. Max. temperature is 245° F.

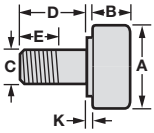
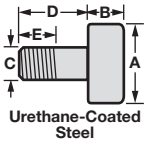
Ultra-Quiet Threaded Track Rollers



Nylon-Coated Steel



Urethane-Coated Steel

The soft rubber or plastic surface on these rollers creates less noise than the metal surfaces found on other track rollers. Also known as cam followers, track rollers support loads while guiding and positioning work. All rollers have end seals to protect rolling elements from dirt and contamination. Mounting nut not included. Maximum temperature is 200° F.

Nylon-coated steel rollers have a nonconductive roller surface and are more chemical resistant than urethane-coated rollers. They are permanently lubricated. All have ball bearings, which create less friction than needle roller bearings, so you can run them at higher speeds. They have a hex socket in the stud end. They are not rated for speed. Hardness is Rockwell C85.

Urethane-coated steel rollers provide better traction and abrasion resistance than nylon-coated rollers. Lubrication holes are in the side and the end of the stud, unless noted. All have needle roller bearings and a hex socket head. They are not rated for speed or load. Hardness is Shore 80A.

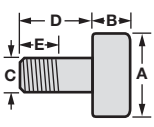
Extreme-Temperature Threaded Track Rollers



Lubricated with graphite, these rollers can handle temperatures from -425° to 750° F—the widest temperature range of any track roller in our offering. Also known as cam followers, track rollers support loads while guiding and positioning work. Mounting nut not included. All rollers have plain bearings embedded with lubrication and end seals to protect rolling elements from dirt and contamination. They are steel and have a slotted head.

Maintenance-Free Threaded Track Rollers

Because you'll never need to add lubrication to these rollers, you can install them in hard-to-reach places. Also known as cam followers, track rollers support loads while guiding and positioning work. All rollers have end seals to protect rolling elements from dirt and contamination. Mounting nut is included.

Steel rollers have sleeve bearings and a hex socket head. Maximum rpm is 1,200. Maximum temperature is 150° F.

Ultra-corrosion-resistant fiberglass-reinforced nylon rollers are fully submersible, nonsparking, and lightweight. All have dry-running PTFE sleeve bearings and a hex socket in the stud end. The stud is 303 stainless steel. They are not rated for speed. Maximum temperature is 250° F.

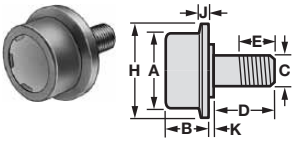
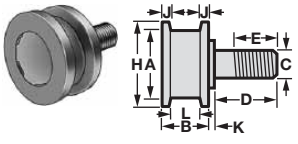
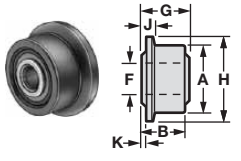
Flanged Track Rollers



Threaded with Single Flange



Threaded with Double Flange



Shaft Mount

The flange provides guidance and helps the roller stay on track. They handle both radial and thrust (top and side) loads. All rollers are permanently lubricated and have end seals to retain lubricant and protect rolling elements from dirt and contamination. Maximum temperature is 225° F.

Threaded rollers have ball bearings, unless noted. All have a hex socket in the stud end. Mounting nut is included.

Shaft-mount rollers are steel with tapered roller bearings.

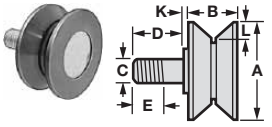
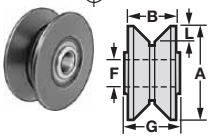
V-Groove Track Rollers



Threaded



Shaft Mount

Rollers handle radial and thrust (top and side) loads and work well in dirty environments because debris falls off the angled rail (rails sold separately on this page). Also known as cam followers, track rollers support loads while guiding and positioning work. All rollers are permanently lubricated and have end seals to retain lubricant and protect rolling elements from dirt and contamination. All are steel. Maximum temperature is 225° F.

Threaded rollers have ball bearings and a hex socket in the stud end. Mounting nut is included.

Shaft-mount rollers have tapered roller bearings.

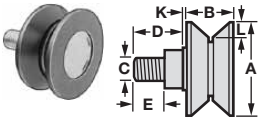
Threaded V-Groove Track Rollers with Adjustable Shoulder



Also known as eccentric track rollers, the shoulder adjusts up or down (up to 0.03") to align to your track, enabling uniform alignment among rollers in a system. They handle radial and thrust (top and side) loads and work well in dirty environments because debris falls off the angled rail (rails sold separately on this page). All rollers are permanently lubricated and have end seals to retain lubricant and protect rolling elements from dirt and contamination. They are steel and have ball bearings and a hex socket in the stud end. Mounting nut is included. Maximum temperature is 225° F.

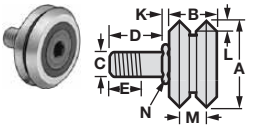
Metric V-Groove Threaded Track Rollers



Rollers are for use with angle rails (sold separately on this page). They handle radial and thrust (top and side) loads and work well in dirty environments because debris falls off the angled rail. Also known as cam followers, track rollers support loads while guiding and positioning work. All rollers are permanently lubricated and have end seals to retain lubricant and protect rolling elements from dirt and contamination. They have ball bearings and an external hex drive on the shoulder. Mounting nut is included.

Adjustable-shoulder rollers are also known as eccentric track rollers. The shoulder adjusts up or down to align to your track, enabling uniform alignment among rollers in a system.

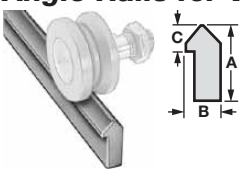
Angle Rails for V-Groove Track Rollers



Use these rails with any track rollers that have a 90° V-groove. All are steel. **To Order:** Please specify length: 1, 2, 3, 4, 5, or 6 feet.

Hardened Steel—The contact surface has a Rockwell hardness of C53 for improved wear resistance over unhardened steel rails. The bottom can be drilled for mounting.

O'all Ht. (A)	O'all Wd. (B)	Angle Ht. (C)	Hardened Steel	Hardened Steel Per Ft.	Unhardened Steel	Unhardened Steel Per Ft.

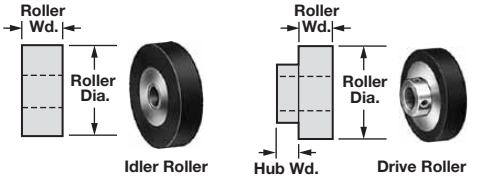
Oil-Resistant Idler and Drive Rollers



Made of neoprene rubber, these rollers resist oil, flames, gasoline, and weather. Durometer is 55A (medium hardness). Temperature range is -40° to 170° F. Color is black.

Idler Rollers—Commonly found in conveyor systems and printing equipment, these rollers spin freely on a shaft or stud to position and guide work. Their roller surface is bonded to an SAE 841 bronze sleeve bearing.

Drive Rollers—These rollers have tapped hubs that allow you to mount them onto a shaft or stud with set screws (not included) to transmit power. Their roller surface is bonded to an aluminum hub.

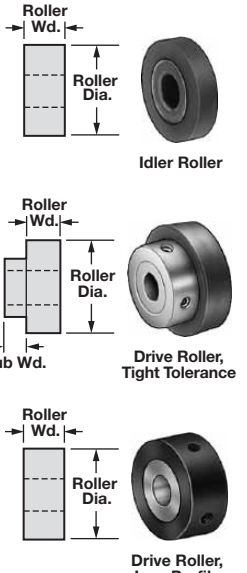
Abrasion-Resistant Idler and Drive Rollers



These urethane rollers are nonmarring and wear resistant. Temperature range is -40° to 180° F. Rollers are color coded by durometer: 55A is blue and 70A is orange. **To Order:** Please specify durometer: 55A (medium) or 70A (hard).

Idler Rollers—Commonly found in conveyor systems and printing equipment, they spin freely on a shaft or stud to position and guide work. Their roller surface is bonded to an SAE 841 oil-embedded sleeve bearing.

Drive Rollers—These rollers have tapped aluminum hubs that allow you to mount them onto a shaft or stud with two set screws (included) to transmit power. *Tight-tolerance* roller diameters are molded to a tolerance of ±0.003". Tolerance for ID is 0.000" to +0.001". *Low-profile* rollers have their mounting holes tapped directly through the roller's surface so you can install them with set screws and still fit them into tight spots.

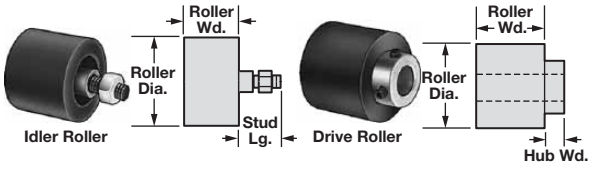
★Roller width is 1/4".

Extra-Wide Vibration-Damping Idler and Drive Rollers



With their large footprint, these rollers minimize vibration. **Idler rollers** are commonly found in conveyor systems and printing equipment. They spin freely on an included stud to position and guide work. The stud is steel. **Drive rollers** mount to a shaft to transmit power. All have a steel hub (unless noted) that is tapped for mounting with the included set screws.

Oil Resistant—Made of neoprene rubber, these rollers resist oil, flames, gasoline, and weather. Temperature range is -40° to 200° F. Color is black.

Abrasion Resistant—These urethane rollers are nonmarring and wear resistant. Temperature range is -65° to 200° F. Color coded by durometer: 35A is yellow, 60A is blue-green, and 80A is red.

To Order: Please specify durometer: 35A (soft), 60A (medium) or 80A (hard), unless noted.

★Aluminum hub. ▲Available in 35A and 80A durometer only.
■Available in 60A durometer only.

No-Stick Idler Rollers

A slippery UHMW polyethylene surface means these rollers won't stick to adjacent parts. Rollers are also highly corrosion resistant. Commonly found in conveyor systems and printing equipment, idler rollers spin freely on a shaft or stud to position and guide work. Durometer is 68D (hard). Temperature range is -22° to 180° F. Color is white.

Rollers with MDS-filled nylon bearing have a rigid, wear- and abrasion-resistant bearing for increased life over all-UHMW rollers.

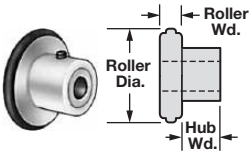
Slim-Tread Drive Rollers



A narrow O-ring tread provides both a sure grip and a delicate touch, making these rollers good for light duty tasks such as those involving paper and tape. The rollers have tapped hubs that allow you to mount them onto a shaft or stud with a set screw (included) to transmit power. O-ring is Buna-N, which is nonmarring and resistant to oil and abrasion. Hub is made of lightweight acetal. Durometer is 70A (hard). Temperature range is -30° to 250° F.

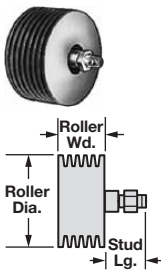
Self-Cleaning Idler Rollers



Ridges on the surface push dirt and debris out of the way and protect delicate surfaces. Commonly found in conveyor systems and printing equipment, idler rollers spin freely on an included stud to position and guide work. The stud is steel. **To Order:** Where applicable, please specify durometer: 35A (soft) or 60A (medium).

Oil Resistant—Made of neoprene rubber, these rollers resist oil, flames, gasoline, and weather. Temperature range is -40° to 200° F. Color is black.

Abrasion Resistant—These urethane rollers are nonmarring and wear resistant. Temperature range is -65° to 200° F. Color coded by durometer: 35A is yellow and 60A is blue-green.

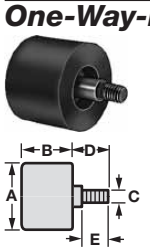
One-Way-Locking Threaded Idler/Drive Rollers



Needle-roller clutch bearings allow these rollers to spin freely in one direction and lock to transmit power in the other. Idler direction is clockwise when facing the roller end. Stud is steel. Durometer is 60A (medium).

Oil Resistant—Made of neoprene rubber, rollers are oil, flame, gasoline, and weather resistant. Temperature range is -40° to 200° F. Color is black.

Abrasion Resistant—These urethane rollers are nonmarring and wear resistant. Temperature range is -65° to 200° F. Color is blue-green.

Press-Fit Low-Profile Drive Rollers

The simple plain-bore design lets you install these rollers onto a shaft without the need for set screws or keyways. With a non-protruding hub, they fit where standard drive rollers can't. Drive rollers spin in unison with a shaft or stud to transmit power. The neoprene surface resists oil, flames, gasoline, and weather. Hub is aluminum. Durometer is 55A (medium). Temperature range is -40° to 170° F. Color is black.

Rollers

Mount rollers directly onto your shaft or build a custom roller by adding your own bushing (for bushings, see 5926K Quick-Grip Screw-Clamp Bushings on page 1093). All consist of a roller surface bonded to a steel hub. **To Order:** Please specify durometer: 35A (soft) or 60A (medium).

Oil Resistant—Made of neoprene rubber, these rollers resist oil, flames, gasoline, and weather. Temperature range is -40° to 200° F. Color is black.

Abrasion Resistant—These urethane rollers are nonmarring and wear resistant. Temperature range is -65° to 200° F. Color coded by durometer: 35A is yellow, 60A is blue-green.

Flex-Grip Drive Rollers

The teardrop-shaped sidewall holes and soft surface allow the roller to gently grab and maintain contact as it is compressed. Perfect for bottling and sheet metal applications. These rollers have tapped hubs that allow you to mount them onto a shaft or stud with two set screws (included) to transmit power. Hub is made of steel.

Oil-Resistant Neoprene—These rollers resist oil, flames, gasoline, and weather. Temperature range is -40° to 200° F. Color is black.

Oil-Resistant Buna-N—These rollers are also abrasion resistant and nonmarring. Temperature range is -60° to 175° F. Color is white.

Abrasion Resistant—These urethane rollers are wear and chemical resistant. They're also nonmarring. Temperature range is -65° to 200° F. Color is yellow.

Keyed Drive Rollers

Use rollers with a keyed shaft to prevent slippage in high-torque applications. Drive rollers spin in unison with a shaft or stud to transmit power. They mount to the shaft with two set screws (included). See page 3588 for durometer information.

Oil Resistant—A good choice for oily environments, these Buna-N rollers are also abrasion resistant and nonmarring. Durometer is 70A (hard). Temperature range is -20° to 180° F. Color is black.

Abrasion Resistant—These urethane rollers are wear and chemical resistant. They're also nonmarring. Durometer is 85A (hard). Temperature range is -20° to 120° F. Color is red.

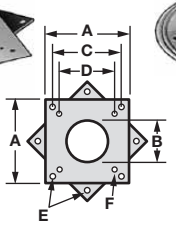
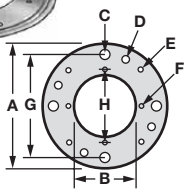
Corrosion-Resistant Turntables

Square



Round



Put a spin on your displays, industrial assemblies, and many other "lazy Susan" applications. All of these corrosion-resistant turntables have stamped plates and contain ball bearings that are housed in a large circular race. They also have a space-saving design that's only 5/16" high. Mounting fasteners not included. ***Lubricated turntables*** provide smoother, quieter motion.

Aluminum—Lightweight aluminum plates with stainless steel ball bearings.

Galvanized Steel—Galvanized steel plates with steel ball bearings.

Black Finish—Smooth steel plates with a black finish and steel ball bearings.

Yellow Chromate—Zinc-plated steel plates with a yellow-chromate finish and stainless steel ball bearings.

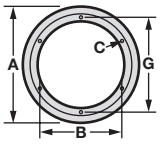
Large-Diameter Ring-Style Turntables



Perfect for adding a revolving feature to bulky equipment. All of these turntables are corrosion resistant and have ball bearings. Weight rests on pads along the outer ring. Mounting fasteners not included.

The 18635A52 *turntable* also has six 5/16"-18 holes (spaced 12.38" center to center) for fastening to the load surface.

♣ Five equally spaced spokes with five spacers and one 0.17" mounting hole at the center of the spokes.

Large-Diameter Solid-Surface Turntables

Able to handle up to 220-lb. loads, these turntables have a textured, solid plastic surface to keep whatever you're rotating in place. They also have fully enclosed ball bearings to keep out debris. Made of high-impact plastic. Color is black.

Load Cap., lbs.	Ht.	O'all Dia.		Each

Light Duty Plastic Turntables

Nothing fancy, just economical, lightweight plastic turntables with ball bearings. Use glue to keep them in place.

Solid-Surface Turntables— **To Order:** Please specify color: black, clear, or white.

Sloped Solid-Surface Turntable— Has a 9″ diameter top that slopes to a 12″ diameter base. A great choice if the base will be visible. **To Order:** Please specify color: black, clear, or white.

Offset Solid-Surface Turntable— Has a 14″ diameter top and a 9″ diameter base. Color is clear.

Ring-Style Turntables— Color is clear.

Heavy Duty Turntables

Use these rugged turntables on welding tables, industrial workstations, material container stands, and as fifth wheels on carts. All have ball bearings that ride in a precision-hardened raceway for smooth rotary motion. To mount turntable plates, weld or bolt them with standard Grade 5 or better hex-head bolts, unless noted. Mounting fasteners not included.

Lockable turntables have slotted grooves that let you lock the turntable into any of four evenly spaced positions using the included spring-loaded pull ring. ***Nonlockable turntables*** have grease fittings, unless noted.

■ No grease fittings. ▲ Use flat head screws for mounting due to limited clearance between plates.
● Has grease fittings.

Permanently Lubricated Industrial Turntables

No additional lubrication is ever needed because these turntables have fully sealed ball bearings. The top plate has a milled-flat level surface—great for welding tables and industrial assemblies. All turntables have a steel top plate and bearings. The base is cast iron. To mount turntable plates, weld or bolt them with standard hex-head bolts. Mounting fasteners not included.

Lockable turntables have slotted grooves that let you position the turntable into any of four evenly spaced points using the included spring-loaded pull ring. If you want the turntable to spin freely, just pull out the ring and turn the ring 90°.

Plain-Bearing and Extreme-Capacity Turntables

Plain-Bearing Turntables— Also known as slewing ring bearings, these self-lubricating bearings are maintenance free. Each has polymer plain bearings housed in aluminum rings to provide excellent vibration damping. Mounting fasteners not included.

Extreme-Capacity Turntables— By far, these have the largest load capacities of any turntables we offer. Each has steel ball bearings housed in hardened steel rings. Mount with SAE Grade 8 hex-head bolts with coarse threads (not included).

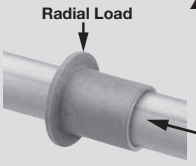
About Sleeve, Flanged Sleeve, and Thrust Bearings



Also known as plain or plane bearings, these bearings allow smooth, low-friction motion between two surfaces. The load is supported through the motion of one solid surface against another.

All bearings are designed to handle either radial loads, thrust loads, or both. Radial load is the load that is perpendicular to the shaft. Thrust load is the load that is parallel to the shaft. **Sleeve bearings** handle radial loads. **Flanged sleeve bearings** handle both radial and thrust loads. **Thrust bearings** handle thrust loads.

Oil-Embedded Sleeve Bearings

Startup friction causes these porous bronze bearings to release a thin layer of oil on the bearing's surface.

Standard—Bearings are SAE 841 bronze embedded with SAE 30 oil. They are also known as Oilite® bearings. Temperature range is -35° to 300°F.

High Load—Bearings have increased iron content, making them stronger and more resistant to shock loads than standard bearings. Color is silver because of the iron. *Iron-copper bronze* bearings have a temperature range of 10° to 220°F and are lubricated with SAE 90 oil. *SAE 863 iron-copper bronze* bearings have a temperature range is -15° to 300°F and are lubricated with ISO 460 oil.

Food Grade—Embedded with oil that meets USDA H1, these bearings are suitable for incidental contact with food. *SAE 841 bronze* bearings run at higher speeds than SAE 863 iron-copper bronze bearings. *SAE 863 iron-copper bronze* bearings have increased iron content, making them stronger and more resistant to shock loads than SAE 841 bronze bearings. Color is silver because of the iron. Temperature range is -75° to 300°F.

Ultra-Low Friction with PTFE—For applications with frequent starts and stops, these SAE 841 bronze bearings are embedded with SAE 80 oil that contains particles of slippery PTFE. The PTFE reduces wear during startup, before the oil is warm enough to lubricate the bearing. Temperature range is 10° to 220°F.

Note: The load capacity at speed is the maximum load a bearing can withstand at a given shaft speed. If the bearing's surface speed and load are below the values listed, the bearing should work for your application.

Standard—SAE 841 Bronze

SAE 863 Iron-Copper Bronze

Choose a Size

High Load SAE 863 — Choose a shaft dia., OD, and length. Dimensions are the same as Standard SAE 841 bronze bearings on pg. 1164, except not available in shaft diameters of 3⁄64″, 1⁄16″, 5⁄64″, 3⁄32″, 5⁄32″, 7⁄32″, 13⁄16″, 1 1⁄16″, 1⅝″, 1⅞″, 1 15⁄16″, 2 3⁄16″, and 3″ with a 4″ OD. **2868T312**

Food Grade SAE 863 — Choose a shaft dia., OD, and length. Dimensions are the same as the Food-Grade SAE 841 bronze bearings above. **6952K6**

Metric Oil-Embedded Sleeve Bearings

Startup friction causes these porous bronze bearings to release a thin layer of oil on the bearing's surface. They are also known as Oilite® bearings. They are SAE 841 bronze lubricated with SAE 30 oil. Temperature range is -35° to 300° F.

Note: The load capacity at speed is the maximum load a bearing can withstand at a given shaft speed. If the bearing's surface speed and load are below the values listed, the bearing should work for your application.

OD, mm	Lg., mm	Load Cap. @ Speed		
For 1.5 mm Shaft Dia.—Load @ 1,500 rpm

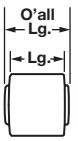
Vibration-Damping Oil-Embedded Sleeve Bearings



With a flexible layer of neoprene sandwiched between an SAE 841 bronze bearing and rigid steel shell, these bearings reduce wear and machinery noise. Startup friction causes the bronze to sweat, producing a thin layer of oil on the bearing's surface. Embedded with SAE 30 oil. Temperature range is 0° to 220° F.

For Shaft Dia.	OD	Lg.	O'all Lg.	Load Cap. @ Speed

5/8"	1 1/4"	1 1/8"	1 1/4"	1,000 lbs. @ 150 rpm	6364K33	12.60
3/4"	1 1/4"	1 1/8"	1 1/4"	1,500 lbs. @ 100 rpm	6364K34	11.40
1"	1 5/8"	1 3/8"	1 1/2"	2,500 lbs. @ 90 rpm	6364K36	17.53

Dry-Running Sleeve Bearings

Made of slippery plastics, these bearings reduce friction without the need for lubrication.

Light Duty—*Nylon* bearings are for light loads. Color is white. Temp. range is -20° to 250° F. *MDS-filled nylon* bearings create less friction than standard nylon bearings, making them more wear resistant. Color is black. Temp. range is -40° to 170° F, unless noted. *Acetal* bearings are more chemical resistant than nylon and MDS-filled nylon bearings. Color is white. Temp. range is -20° to 180° F.

Ultra-Low Friction—Use these bearings in applications with frequent starts and stops because they operate with very little friction. They also can withstand a wide range of temperatures. *PTFE* bearings are slippery and chemical resistant. Color is white. Temp. range is -350° to 500° F. *Rulon J* bearings create the least amount of friction of any bearing in our offering. They handle higher loads and speeds than PTFE bearings. Color is gold. Temp. range is -400° to 550° F.

Water Resistant—A good choice for underwater applications, these Rulon LR bearings won't warp when exposed to moisture. Color is maroon. Temp. range is -400° to 550° F.

Chemical Resistant—*Glass-filled PTFE* bearings offer the same low-friction and chemical resistance properties as ultra-low friction PTFE bearings, along with increased load and speed capacity. Color is white. Temp. range is -350° to 500° F. *PEEK* bearings are lightweight, strong, and able to withstand a wide range of chemicals. Color is black. Temp. range is -40° to 500° F. *PTFE-lined fiberglass* bearings resist vibration while handling high loads in wet, corrosive environments. Color is brown. Temp. range is -140° to 350° F.

Extreme Load—These Vespel® polyimide bearings are our highest performing sleeve bearings. They handle high loads at high speeds and withstand heat and chemicals in harsh environments. Color is black. Temp. range is -400° to 550° F.

Food Grade—Made of FDA-listed materials for use in food applications, these bearings also withstand caustic and washdown environments. *UHMW* bearings perform well in wet, corrosive environments. Color is white. Temp. range is -200° to 180° F. *Rulon 641* bearings are stronger than UHMW bearings and can withstand a wider range of temperatures. Temp. range is -400° to 550° F.

Note: The load capacity at speed is the maximum load a bearing can withstand at a given shaft speed. If the bearing's surface speed and load are below the values listed, the bearing should work for your application.

(Continued on following page)

Dry-Running Sleeve Bearings *(Continued from previous page)*

Made of slippery plastics, these bearings reduce friction without the need for lubrication.

Light Duty—*Nylon* bearings are for light loads. Color is white. Temp. range is -20° to 250° F. *MDS-filled nylon* bearings create less friction than standard nylon bearings, making them more wear resistant. Color is black. Temp. range is -40° to 170° F, unless noted. *Acetal* bearings are more chemical resistant than nylon and MDS-filled nylon bearings. Color is white. Temp. range is -20° to 180° F.

Ultra-Low Friction—Use these bearings in applications with frequent starts and stops because they operate with very little friction. They also can withstand a wide range of temperatures. *PTFE* bearings are slippery and chemical resistant. Color is white. Temp. range is -350° to 500° F. *Rulon J* bearings create the least amount of friction of any bearing in our offering. They handle higher loads and speeds than PTFE bearings. Color is gold. Temp. range is -400° to 550° F.

Water Resistant—A good choice for underwater applications, these Rulon LR bearings won't warp when exposed to moisture. Color is maroon. Temp. range is -400° to 550° F.

Chemical Resistant—*Glass-filled PTFE* bearings offer the same low-friction and chemical resistance properties as ultra-low friction PTFE bearings, along with increased load and speed capacity. Color is white. Temp. range is -350° to 500° F. *PEEK* bearings are lightweight, strong, and withstand a wide range of chemicals. Color is black. Temp. range is -40° to 500° F. *PTFE-lined fiberglass* bearings resist vibration while handling high loads in wet, corrosive environments. Color is black. Temp. range is -58° to 280° F.

Extreme Load—These Vespel® polyimide bearings are our highest performing sleeve bearings. They handle high loads at high speeds and withstand heat and chemicals in harsh environments. Color is black. Temp. range is -400° to 550° F.

Food Grade—Made of FDA-listed materials for use in food applications, these bearings also withstand caustic and washdown environments. Color is white. *UHMW* bearings perform well in wet, corrosive environments. Temp. range is -200° to 180° F. *Rulon 641* bearings are stronger than UHMW bearings and can withstand a wider range of temperatures. Temp. range is -400° to 550° F.

Note: The load capacity at speed is the maximum load a bearing can withstand at a given shaft speed. If the bearing's surface speed and load are below the values listed, the bearing should work for your application.

Metric Ultra-Low Friction—PTFE

Choose a shaft diameter, OD, and length. Dimensions are the same as the Metric Light Duty Acetal bearings above. 2685T1

Dry-Running Sleeve Bearings with Metal Shell

Frelon with Aluminum Shell

PTFE with 17-4 PH Stainless Steel Shell

A metal shell adds strength to these bearings.

PTFE-lined tin bronze bearings with steel shell have a slit running along the length of the bearing that allows you to slip fit them onto a shaft. Temperature range is -320° to 530° F, unless noted.

Frelon bearings with aluminum shell are both slippery and chemically inert. The aluminum shell provides corrosion resistance. Temperature range is -400° to 400° F.

PTFE bearings with 17-4 PH stainless steel shell are chemical resistant. The PTFE is woven for increased strength and resistance to shock loads. Meet MIL-B-81820, MIL-B-81934, SAE AS81820, and SAE AS81934 specifications. Temperature range is -60° to 320° F.

Note: The load capacity at speed is the maximum load a bearing can withstand at a given shaft speed. If the bearing's surface speed and load are below the values listed, the bearing should work for your application.

High-Temperature Dry-Running Sleeve Bearings

Graphite provides a layer of dry lubrication that can operate in high-temperature environments.

Embedded—*SAE 841 bronze* bearings are porous and embedded with graphite for continuous lubrication. Temperature range is -50° to 700° F. *Graphalloy* bearings perform at extreme temperatures and under water. They are electrically conductive and wear resistant. Temperature range is -450° to 750° F.

Filled Groove—A filled groove on the inside of the bearing distributes the graphite evenly along the bearing's surface. *SAE 660 leaded tin bronze* bearings are cast, making them strong, wear resistant, and excellent at handling shock loads. Temperature range is -350° to 450° F. *954 aluminum bronze* bearings offer high strength and excellent corrosion resistance, making them suitable for use in marine and mining applications. Temperature range is -350° to 500° F.

Note: The load capacity at rated speed is the maximum load a bearing can withstand at a given shaft speed. If the bearing's surface speed and load are below the values listed, the bearing should work for your application.

High-Temperature Dry-Running Sleeve Bearings *(Continued from previous page)*

Embedded

Filled Groove

Graphite provides a layer of dry lubrication that can operate in high-temperature environments.

Embedded—*SAE 841 bronze* bearings are porous and embedded with graphite for continuous lubrication. Temperature range is -50° to 700°F. *Graphalloy* bearings perform at extreme temperatures and under water. They are electrically conductive and wear resistant. Temperature range is -450° to 750°F.

Filled Groove—A filled groove on the inside of the bearing distributes the graphite evenly along the bearing's surface. *SAE 660 leaded tin bronze* bearings are cast, making them strong, wear resistant, and excellent at handling shock loads. Temperature range is -350° to 450°F. *954 aluminum bronze* bearings offer high strength and excellent corrosion resistance, making them suitable for use in marine and mining applications. Temperature range is -350° to 500°F.

Note: The load capacity at rated speed is the maximum load a bearing can withstand at a given shaft speed. If the bearing's surface speed and load are below the values listed, the bearing should work for your application.

Multipurpose and Corrosion-Resistant Sleeve Bearings

Multipurpose

Grooved Multipurpose

These cast metal bearings handle higher loads than oil-embedded and dry-running sleeve bearings, and they perform well in dusty environments. All require lubricant.

Multipurpose SAE 660 Leaded Tin Bronze—Bearings are strong, wear resistant, and excellent at handling shock loads. Temperature range is -350° to 450°F.

Corrosion-Resistant 954 Aluminum Bronze—Bearings are made with aluminum and iron for high strength and excellent corrosion resistance. They are often used in marine and mining applications. Temperature range is -350° to 500°F.

Grooved bearings have a figure-8-shaped groove that provides a flow path for lubricant, distributing it evenly along the bearing's surface.

Note: The load capacity at rated speed is the maximum load a bearing can withstand at a given shaft speed. If the bearing's surface speed and load are below the values listed, the bearing should work for your application.

Multipurpose and Corrosion-Resistant Sleeve Bearings *(Continued from previous page)*

Multipurpose

Grooved Multipurpose

These cast metal bearings handle higher loads than oil-embedded and dry-running sleeve bearings, and they perform well in dusty environments. All require lubricant.

Multipurpose SAE 660 Leaded Tin Bronze—Bearings are strong, wear resistant, and excellent at handling shock loads. Temperature range is -350° to 450°F.

Corrosion-Resistant 954 Aluminum Bronze—Bearings are made with aluminum and iron for high strength and excellent corrosion resistance. They are often used in marine and mining applications. Temperature range is -350° to 500°F.

Grooved bearings have a figure-8-shaped groove that provides a flow path for lubricant, distributing it evenly along the bearing's surface.

Note: The load capacity at rated speed is the maximum load a bearing can withstand at a given shaft speed. If the bearing's surface speed and load are below the values listed, the bearing should work for your application.

Grooved Multipurpose— SAE 660 Leaded Tin Bronze

Oil-Embedded Flanged Sleeve Bearings

Startup friction causes these porous bronze bearings to release a thin layer of oil on the bearing's surface.

Standard—Bearings are SAE 841 bronze embedded with SAE 30 oil. They are also known as Oilite® bearings. Temperature range is -35° to 300°F. *Bearings with certification* come with a material test report and a traceable lot number.

High Load—Bearings have increased iron content, making them stronger and more resistant to shock loads than standard oil-embedded bearings. Color is silver because of the iron. Temperature range is 10° to 220°F. *Iron-copper bronze* bearings are lubricated with SAE 90 oil. *SAE 863 iron-copper bronze* bearings are lubricated with ISO 460 oil.

Food Grade—Embedded with oil that meets USDA H1, these bearings are suitable for incidental contact with food. *SAE 841 bronze* bearings run at higher speeds than SAE 863 iron-copper bronze bearings. Temperature range is 10° to 220°F. *SAE 863 iron-copper bronze* bearings have increased iron content, making them stronger and more resistant to shock loads than SAE 841 bronze bearings. Color is silver because of the iron. Temperature range is -30° to 420°F.

Ultra-Low Friction—For applications with frequent starts and stops, these SAE 841 bronze bearings are embedded with SAE 80 oil that contains particles of slippery PTFE. The PTFE reduces wear during startup, before the oil is warm enough to lubricate the bearing. Temperature range is 10° to 220°F.

Note: The load capacity at speed is the maximum load a bearing can withstand at a given shaft speed. If the bearing's load and speed are below the values listed, the bearing should work for your application.

(Continued on following page)

Oil-Embedded Flanged Sleeve Bearings *(Continued from previous page)*

Startup friction causes these porous bronze bearings to release a thin layer of oil on the bearing's surface.

Standard—Bearings are SAE 841 bronze embedded with SAE 30 oil. They are also known as Oilite® bearings. Temperature range is -35° to 300° F. *Bearings with certification* confirm material and dimensional conformity.

High Load—Bearings have increased iron content, making them stronger and more resistant to shock loads than standard oil-embedded bearings. Color is silver because of the iron. *Iron-copper bronze* bearings have a temperature range of 10° to 220° F and are lubricated with SAE 90 oil. *SAE 863 iron-copper bronze* bearings have a temperature range of -15° to 300° F. are lubricated with ISO 460 oil.

Food Grade—Embedded with oil that meets USDA H1, these bearings are suitable for incidental contact with food. Temperature range is -75° to 300° F. *SAE 841 bronze* bearings run at higher speeds than SAE 863 iron-copper bronze bearings. *SAE 863 iron-copper bronze* bearings have increased iron content, making them stronger and more resistant to shock loads than SAE 841 bronze bearings. Color is silver because of the iron.

Ultra-Low Friction—For applications with frequent starts and stops, these SAE 841 bronze bearings are embedded with SAE 80 oil that contains particles of slippery PTFE. The PTFE reduces wear during startup, before the oil is warm enough to lubricate the bearing. Temperature range is 10° to 220° F.

Note: The load capacity at speed is the maximum load a bearing can withstand at a given shaft speed. If the bearing's load and speed are below the values listed, the bearing should work for your application.

Dry-Running Flanged Sleeve Bearings

Made of slippery plastics, these bearings reduce friction without the need for lubrication.

Light Duty—*Nylon* bearings are for light loads. Color is white. Temp. range is -20° to 250°F. *MDS-filled nylon* bearings create less friction than standard nylon bearings, making them more wear resistant. Color is black. Temp. range is -40° to 220°F, unless noted. *Acetal* bearings are more chemical resistant than nylon bearings. Color is white. Temp. range is -20° to 180°F.

Ultra-Low Friction—Use these bearings in applications with frequent starts and stops because they operate with very little friction. They also can withstand a wide range of temperatures. *PTFE* bearings are slippery and chemical resistant. Color is white. Temp. range is -350° to 500°F. *Rulon J* bearings create the least amount of friction of any bearing in our offering. They handle higher loads and speeds than PTFE bearings. Color is gold. Temp. range is -400° to 550°F.

Water Resistant—A good choice for underwater applications, these Rulon LR bearings won't warp when exposed to moisture. Color is maroon. Temp. range is -400° to 550°F.

Chemical Resistant—These PEEK bearings are lightweight, strong, and able to withstand a wide range of chemicals. Color is black. Temp. range is -40° to 500°F.

Food Grade—Made of FDA-listed materials for use in food applications, these bearings also withstand caustic and washdown environments. Color is white. *UHMW* bearings perform well in wet, corrosive environments. Temp. range is -200° to 180°F. *Rulon 641* bearings are stronger than UHMW bearings and can withstand a wider range of temperatures. Temp. range is -400° to 550°F.

Note: The load capacity at speed is the maximum load a bearing can withstand at a given shaft speed. If the bearing's surface speed and load are below the values listed, the bearing should work for your application.

★Max. temperature is 170°F.

(Continued on following page)

Dry-Running Flanged Sleeve Bearings *(Continued from previous page)*

Made of slippery plastics, these bearings reduce friction without the need for lubrication.

Light Duty—*Nylon* bearings are for light loads. Color is white. Temp. range is -20° to 250° F. *MDS-filled nylon* bearings create less friction than standard nylon bearings, making them more wear resistant. Color is black. Temp. range is -40° to 220° F, unless noted. *Acetal* bearings are more chemical resistant than nylon bearings. Color is white. Temp. range is -20° to 180° F.

Ultra-Low Friction—Use these bearings in applications with frequent starts and stops because they operate with very little friction. They also can withstand a wide range of temperatures. *PTFE* bearings are slippery and chemical resistant. Color is white. Temp. range is -350° to 500° F. *Rulon J* bearings create the least amount of friction of any bearing in our offering. They handle higher loads and speeds than PTFE bearings. Color is gold. Temp. range is -400° to 550° F.

Water Resistant—A good choice for underwater applications, these Rulon LR bearings won't warp when exposed to moisture. Color is maroon. Temp. range is -400° to 550° F.

Chemical Resistant—These PEEK bearings are lightweight, strong, and able to withstand a wide range of chemicals. Color is black. Temp. range is -40° to 500° F.

Food Grade—Made of FDA-listed materials for use in food applications, these bearings also withstand caustic and washdown environments. Color is white. *UHMW* bearings perform well in wet, corrosive environments. Temp. range is -200° to 180° F. *Rulon 641* bearings are stronger than UHMW bearings and can withstand a wider range of temperatures. Temp. range is -400° to 550° F.

Note: The load capacity at speed is the maximum load a bearing can withstand at a given shaft speed. If the bearing's surface speed and load are below the values listed, the bearing should work for your application.

(Continued on following page)

Dry-Running Flanged Sleeve Bearings *(Continued from previous page)*

Made of slippery plastics, these bearings reduce friction without the need for lubrication.

Light Duty—*Nylon* bearings are for light loads. Color is white. Temperature range is -20° to 250°F. *MDS-filled nylon* bearings create less friction than standard nylon bearings, making them more wear resistant. Color is black. Temperature range is -40° to 220°F, unless noted. *Acetal* bearings are more chemical resistant than nylon bearings. Color is white. Temperature range is -20° to 180°F.

Ultra-Low Friction—Use these bearings in applications with frequent starts and stops because they operate with very little friction. They also can withstand a wide range of temperatures. *PTFE* bearings are slippery and chemical resistant. Color is white. Temperature range is -350° to 500°F. *Rulon J* bearings create the least amount of friction of any bearing in our offering. They handle higher loads and speeds than PTFE bearings. Color is gold. Temperature range is -400° to 550°F.

Water Resistant—A good choice for underwater applications, these Rulon LR bearings won't warp when exposed to moisture. Color is maroon. Temperature range is -400° to 550°F.

Chemical Resistant—These PEEK bearings are lightweight, strong, and able to withstand a wide range of chemicals. Color is black. Temperature range is -40° to 500°F.

Food Grade—Made of FDA-listed materials for use in food applications, these bearings also withstand caustic and washdown environments. Color is white. *UHMW* bearings perform well in wet, corrosive environments. Temperature range is -200° to 180°F. *Rulon 641* bearings are stronger than UHMW bearings and can withstand a wider range of temperatures. Temperature range is -400° to 550°F.

Note: The load capacity at speed is the maximum load a bearing can withstand at a given shaft speed. If the bearing's surface speed and load are below the values listed, the bearing should work for your application.

Dry-Running Flanged Sleeve Bearings with Metal Shell

An aluminum shell adds strength and corrosion resistance to these bearings. Made of Frelon, a PTFE composite, they are both slippery and chemically inert. Temperature range is -400° to 400° F.

Note: The load capacity at speed is the maximum load a bearing can withstand at a given shaft speed. If the bearing's load and speed are below the values listed, the bearing should work for your application.

Dry-Running Split Flanged Sleeve Bearings

A slit running along the length of these nylon bearings allows you to quickly slip them onto a shaft. Temperature range is -40° to 400° F.

Note: The load capacity at speed is the maximum load a bearing can withstand at a given shaft speed. If the bearing's load and speed are below the values listed, the bearing should work for your application.

Extreme-Load Dry-Running Flanged Sleeve Bearings

These Vespel® polyimide bearings are our highest performing flanged sleeve bearings. They handle high loads at high speeds and withstand heat and chemicals in harsh environments. Color is black. Temperature range is -400° to 550° F.

Note: The load capacity at speed is the maximum load a bearing can withstand at a given shaft speed. If the bearing's load and speed are below the values listed, the bearing should work for your application.

Precision Shim Bushing Stock

The tight tolerances on these smooth, low-friction materials allow you to increase or decrease a shaft or rod diameter by slipping the bushing over the shaft or rod. They also fit inside each other to increase more than one wall thickness. Use carbide blades to cut to a specific length for a bushing, spacer, shim, or sleeve bearing. Length is 6".

Delrin® acetal resin combines strength and wear resistance with good chemical resistance. Hardness is Rockwell M94. Condition is extruded. Meets ASTM D4181 and is FDA listed. Temp. range is -4° to 180° F. OD and ID tolerances are ±0.005". Length tolerance is +0.05".

UHMW polyethylene does not absorb moisture and has good wear and corrosion resistance. Hardness is Rockwell D66. Condition is extruded. Meets ASTM D4020 and is FDA listed. Temp. range is -22° to 180° F. OD tolerance is -0.02". ID tolerance is +0.02". Length tolerance is +1/2".

4130 alloy steel offers good weldability. Hardness is Rockwell C30-C45. Temper is annealed with a hardened surface. Condition is cold finished. Meets ASTM A513, except 1 1/2" OD meets ASTM A519. OD tolerance is ±0.035". ID tolerance is ±0.038". Length tolerance is +1/8".

440C stainless steel is harder than steel, with good wear and corrosion resistance. Hardness is Rockwell C55-C60. Temper is full hard. Condition is cold drawn. Meets ASTM A276. OD tolerance is -0.0002". ID tolerance is +0.0002". Length tolerance is ±0.01".

High-Temperature Dry-Running Flanged Sleeve Bearings

SAE 841 Bronze

SAE 660 Leaded Tin Bronze

Graphite provides a layer of dry lubrication that can operate in high-temperature environments.

SAE 841 bronze bearings are porous and embedded with graphite for continuous lubrication. They handle higher temperatures than SAE 660 leaded tin bronze bearings. Temperature range is -50° to 700° F.

SAE 660 leaded tin bronze bearings are cast, making them strong, wear resistant, and excellent at handling shock loads. A filled groove on the inside of the bearing distributes the graphite evenly along the bearing's surface. Temperature range is -70° to 450° F.

Note: The load capacity at speed is the maximum load a bearing can withstand at a given shaft speed. If the bearing's load and speed are below the values listed, the bearing should work for your application.

Multipurpose and Corrosion-Resistant Flanged Sleeve Bearings

These cast metal bearings handle higher loads than oil-embedded and dry-running bearings and perform well in dusty environments.

Multipurpose—Made of SAE 660 leaded tin bronze, these bearings are strong, wear resistant, and excellent at handling shock loads. Temperature range is -350° to 450° F, except metric bearings have a temperature range of -40° to 450° F. *Bearings with certification* come with a material test report and a traceable lot number. Temperature range is -70° to 450° F.

Startup friction causes these porous bronze bearings to release a thin layer of oil on the bearing's surface.

Corrosion Resistant—The aluminum and iron content in these 954 aluminum bronze bearings provides high strength and excellent corrosion resistance, making them suitable for use in marine and mining applications. Temperature range is -350° to 500° F.

Note: The load capacity at speed is the maximum load a bearing can withstand at a given shaft speed. If the bearing's load and speed are below the values listed, the bearing should work for your application.

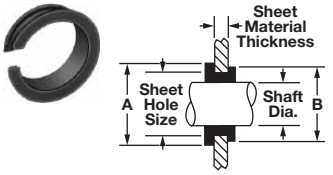
Nylon Snap-In Thrust Bearings



Easily snap these thrust bearings into a variety of thin sheet materials. A gap in the side makes it simple to press them into place and also allows them to expand if they heat up or absorb moisture. The smaller of the two flanges fits into the mounting hole and holds the bearing in place; the larger flange is big enough to handle thrust loads. Made of nylon, all of these bearings require no lubrication and are resistant to many chemicals. **Nylon 642** has a temperature range of –40° to 280°F. **MDS-filled nylon** contains wear-resistant molybdenum disulfide (MDS). Temperature range is –40° to 176°F.

Oil-Embedded Thrust Bearings

Startup friction causes these porous bronze bearings to release a thin layer of oil on the bearing's surface.

Standard—Bearings are SAE 841 bronze embedded with SAE 30 oil. They are also known as Oilite® bearings. Temperature range is -35° to 300°F.

Ultra-Low Friction with PTFE—For applications with frequent starts and stops, these SAE 841 bronze bearings are embedded with SAE 80 oil that contains particles of slippery PTFE. The PTFE reduces wear during startup, before the oil is warm enough to lubricate the bearing. Temperature range is 10° to 220°F.

High Load—Bearings have increased iron content, making them stronger and more resistant to shock loads than standard oil-embedded bearings. Color is silver because of the iron. Temperature range is -15° to 300°F. *Iron-copper bronze* bearings are lubricated with SAE 90 oil. *SAE 863 iron-copper bronze* bearings are lubricated with ISO 460 oil.

Food Grade—Embedded with oil that meets USDA H1, these bearings are suitable for incidental contact with food. Temperature range is -75° to 300°F. *SAE 841 bronze* bearings run at higher speeds than SAE 863 iron-copper bronze bearings. *SAE 863 iron-copper bronze* bearings have increased iron content, making them stronger and more resistant to shock loads than SAE 841 bronze bearings. Color is silver because of the iron.

Note: The load capacity at speed is the maximum load a bearing can withstand at a given shaft speed. If the bearing's load and speed are below the values listed, the bearing should work for your application.

Dry-Running Thrust Bearings

Made of slippery plastics, these bearings reduce friction without the need for lubrication.

Light Duty—*Nylon* bearings are for light loads. Temperature range is -20° to 210° F. *Acetal* bearings are more chemical resistant than nylon bearings. Color is white. Temperature range is -20° to 180° F.

Water Resistant—A good choice for underwater applications, these Rulon LR bearings won't warp when exposed to moisture. Color is maroon. Temperature range is -400° to 550° F.

Chemical Resistant—These PEEK bearings are lightweight, strong, and able to withstand a wide range of chemicals. Color is black. Temperature range is -40° to 500° F.

Ultra-Low Friction—Use these bearings in applications with frequent starts and stops because they operate with very little friction. They also can withstand a wide range of temperatures. *PTFE* bearings are slippery and chemical resistant. Color is white. Temperature range is -350° to 500° F. *Rulon J* bearings create the least amount of friction of any bearing in our offering. They handle higher loads and speeds than PTFE bearings. Color is gold. Temperature range is -400° to 550° F.

Food Grade—Made of FDA-listed materials for use in food applications, these bearings also withstand caustic and washdown environments. Color is white. *UHMW* bearings perform well in wet, corrosive environments. Temperature range is -100° to 180° F. *Rulon 641* bearings are stronger than UHMW bearings and can withstand a wider range of temperatures. Temperature range is -400° to 550° F.

High Load—Not only are these steel bearings strong, they have a PTFE liner on one face that makes them slippery. Temperature range is -320° to 530° F.

Note: The load capacity at speed is the maximum load a bearing can withstand at a given shaft speed. If the bearing's surface speed and load are below the values listed, the bearing should work for your application.

High-Temperature Dry-Running Thrust Bearings

SAE 660 Leaded Tin Bronze

SAE 841 Bronze

Graphite provides a layer of dry lubrication that can operate in high temperature environments.

SAE 660 leaded tin bronze bearings are cast, making them strong, wear resistant, and excellent at handling shock loads. Graphite plugs distribute lubricant evenly along the bearing's surface. Temperature range is -350° to 450° F.

SAE 841 bronze bearings are porous and embedded with graphite for continuous lubrication. They handle higher temperatures than SAE 660 leaded tin bronze bearings. Temperature range is -50° to 700° F.

Note: The load capacity at speed is the maximum load a bearing can withstand at a given shaft speed. If the bearing's load and speed are below the values listed, the bearing should work for your application.

Multipurpose and Corrosion-Resistant Thrust Bearings

These cast metal bearings handle higher loads than oil-embedded and dry-running bearings and perform well in dusty environments.

Multipurpose—Made of SAE 660 leaded tin bronze, these bearings are strong, wear resistant, and excellent at handling shock loads. Temperature range is -350° to 450° F.

Corrosion Resistant—The aluminum and iron content in these 954 aluminum bronze bearings provides high strength and excellent corrosion resistance, making them suitable for use in marine and mining applications. Temperature range is -350° to 500° F.

Note: The load capacity at speed is the maximum load a bearing can withstand at a given shaft speed. If the bearing's load and speed are below the values listed, the bearing should work for your application.

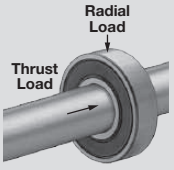
About Ball and Roller Bearings

Ball and roller bearings operate with less friction than plain bearings, so they're often called antifriction bearings.

Ball bearings are primarily for high speeds and moderate radial loads, but they can also handle light thrust loads.

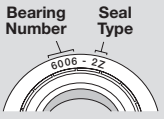
Roller bearings support higher loads than ball bearings but run at lower speeds. There are three types of roller bearings. *Needle-roller* bearings have a thin profile for use in tight spaces. They handle radial loads. *Spherical-roller* bearings generally have higher load capacities than needle and tapered roller bearings. They handle a combination of radial and thrust loads. *Tapered-roller* bearings handle shock loads as well as combination of radial and thrust loads.



Open bearings dissipate heat more efficiently than double-shielded and double-sealed bearings. **Double-shielded** bearings resist dust and contaminants, but do not dissipate heat as efficiently as open bearings. **Double-sealed** bearings offer the best dust resistance, but retain the most heat.

Replacing Ball Bearings

When replacing a ball bearing, locate the trade number on the side and match the bearing number and seal type. Although some trade numbers include additional numbers and letters, size and seal type are commonly printed first. If your bearing does not have a trade number, measure its ID and OD to find a match.



Bearing Number—Bearings with matching bearing numbers will have the same ID and OD.

Seal Type—*Double-shielded* bearings are coded ZZ or 2Z. *Double-sealed* bearings are coded RS or 2RS. *Open* bearings will not show a code for seal type.

Ball Bearings

Open

Double Shielded

Double Sealed

Double Shielded with Retaining Ring

Double Sealed with Retaining Ring

Ball bearings primarily handle radial loads (perpendicular to the shaft) but can also withstand light thrust loads (parallel to the shaft). Made of 52100 steel. *Open* bearings come lubricated with oil, unless noted. *Double-shielded* bearings come greased. *Double-sealed* bearings have Buna-N rubber seals and come greased.

Standard—Bearings meet ABEC-1 dimensional tolerance standards. Temperature range is -20° to 240° F for inch sizes; -20° to 230° F (unless noted) for metric sizes. ***Bearings with retaining ring*** have a removable retaining ring that holds the bearing inside a housing. Temperature range is -40° to 250° F for double-shielded bearings; -40° to 210° F for double-sealed bearings.

Premium—For greater accuracy and higher speeds, these bearings are made to tighter ABEC-3 dimensional tolerances than standard ball bearings. Temperature range is -30° to 240° F.

Standard (ABEC-1)—Inch

■ Max. temperature is 240° F.

(Continued on following page)

Ball Bearings *(Continued from previous page)*

Ball bearings primarily handle radial loads (perpendicular to the shaft) but can also withstand light thrust loads (parallel to the shaft). Made of 52100 steel. *Open* bearings come lubricated with oil, unless noted. *Double-shielded* bearings come greased. *Double-sealed* bearings have Buna-N rubber seals and come greased.

Standard—Bearings meet ABEC-1 dimensional tolerance standards. Temperature range is -20° to 240°F for inch sizes; -20° to 230°F (unless noted) for metric sizes. ***Bearings with retaining ring*** have a removable retaining ring that holds the bearing inside a housing. Temperature range is -40° to 250°F for double-shielded bearings; -40° to 210°F for double-sealed bearings.

Premium—For greater accuracy and higher speeds, these bearings are made to tighter ABEC-3 dimensional tolerances than standard ball bearings. Temperature range is -30° to 240°F.

Permanently Lubricated Ball Bearings

A solid polymer grease fills the space between the balls and the race, virtually eliminating the need for additional lubrication. Because it's solid, the lubricant also blocks out water and dust, extending the life of the bearing. Bearings are 52100 steel and meet ABEC-1 dimensional tolerance standards. Temperature range is 10° to 200°F. *Double-sealed* bearings have Buna-N rubber seals.

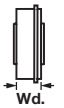
High-Load Ball Bearings

Open

Double Shielded

Double Sealed with Extended Inner Ring and Retaining Ring



Bearings are 52100 steel and come greased. Temperature range is -20° to 250° F. *Double-sealed* bearings have Buna-N rubber seals, unless noted. *Bearings with an extended inner ring* provide additional shaft support. *Bearings with retaining ring* have a removable retaining ring that holds the bearing inside the housing.

Light Duty Ball Bearings

Open

Double Shielded

Flanged Double Sealed

Flanged

Use these light duty bearings for material handling or where precision is not a concern. They come in nonstandard sizes to fit a variety of applications. They are made of 52100 steel. Temperature range is -20° to 250° F, unless noted.

Open bearings come lubricated with oil, unless noted. *Double-shielded* bearings come greased. *Double-sealed* bearings come greased and have Buna-N rubber seals, unless noted. Maximum speed is 1,200 rpm for open bearings; 2,500 rpm for standard double-shielded and double-sealed bearings; and 3,000 rpm for flanged double-sealed bearings, unless noted.

Stainless Steel Ball Bearings

Open

Flanged Double Shielded

Double Sealed

Flanged with Extended Inner Ring

Flanged with Extended Inner Ring

Good for washdown applications, these 440C stainless steel bearings provide increased corrosion resistance over steel ball bearings.

Standard and Premium—Temperature range is -20° to 240° F. *Open* bearings are lubricated with oil, unless noted. *Double-shielded* and *double-sealed* bearings come greased. *Double-sealed* bearings have Buna-N rubber seals, unless noted. *Standard* bearings are made to ABEC-1 dimensional tolerance standards. *Premium* bearings are made to ABEC-3 dimensional tolerance standards.

Precision—Made to ABEC-5 dimensional tolerance standards. They come oiled. Temperature range is -60° to 250° F. *Bearings with extended inner ring* provide additional shaft support.

Ultra Precision—Made to ABEC-7 dimensional tolerance standards. *Open* bearings come oiled and withstand temperatures from -10° to 240° F. *Double shielded* bearings come greased and withstand temperatures from -20° to 250° F, except the flanged bearings withstand temperatures from -60° to 250° F.

Ultra Corrosion-Resistant Stainless Steel Ball Bearings

These 316 stainless steel bearings are even more corrosion resistant than our 440C stainless steel bearings, but they're not as strong. They are open and require lubrication. Temperature range is -40° to 140° F.

Permanently Lubricated Stainless Steel Ball Bearings

Open

Double Sealed

Because these 440C stainless steel bearings have a solid polymer grease filling between the balls and race, they require little to no maintenance, so you can install them in hard-to-reach places. The solid lubricant also blocks out water and dust, extending the life of the bearing. All bearings are made to ABEC-1 dimensional tolerance standards. Double-sealed bearings have Buna-N rubber seals. Temperature range is 10° to 200° F for bearings lubricated with solid lubricant; -20° to 210° F for bearings lubricated with food-grade solid lubricant.

Self-Aligning Flanged Ball Bearings

No need to worry about precisely aligning these bearings—they swivel inside their flanged housing to compensate for up to 5° of shaft misalignment. Bearings are shielded on both sides to block out dust and contaminants. These bearings are 52100 steel and meet ABEC-3 dimensional tolerance standards. Maximum speed is 40,000 rpm, unless noted. Temperature range is -30° to 250° F.

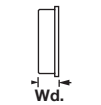
Plastic Ball Bearings

General Purpose

Flanged



Flanged

Plastic ball bearings have excellent corrosion and chemical resistance. All are open bearings and do not require lubrication.

General Purpose Acetal—Choose these bearings for their all-around corrosion and chemical resistance. Temperature range is -40° to 180° F. **Stainless steel** balls offer excellent corrosion resistance. **Glass** balls offer even more corrosion resistance than stainless steel balls. **Flanged** bearings are only available with stainless steel balls.

High-Temperature PEEK—These bearings operate in temperatures up to 480° F, nearly 200° higher than any other ball bearing we offer. They also are strong, resist a wide range of chemicals, and run at higher speeds than other plastic ball bearings. Balls are stainless steel. Minimum temperature is -20° F.

Water Resistant PVDF—Bearings resist moisture absorption, so they won't warp in underwater applications. Balls are stainless steel. Temperature range is -20° to 250° F.

One-Way Locking Ball Bearing Clutches

These bearings have internal locking elements (sprags) that lock to transmit torque in one direction while they turn freely in the other direction. They're often used in pick-and-place and automated indexing conveyor systems, where precision movement is required. Bearings have plastic shields on both sides to block out dust and contaminants. Made of 52100 steel, they meet ABEC-1 dimensional tolerance standards and come greased. Temperature range is -40° to 170° F.

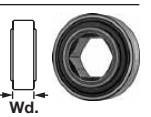
Hex-Bore Ball Bearings

Slip these bearings onto a hex shaft. The hex profile allows you to transmit rotary motion without a precise fit. Made of 52100 steel, these double-sealed bearings meet ABEC-1 dimensional tolerance standards. They come greased and have an extended inner ring that provides additional shaft support. Temperature range is -40° to 220° F.



Bearing No.	For Hex Shaft Size	OD	Wd.	Inner Ring OD	O'all Wd.	Dynamic Load Cap., lbs.	Max. rpm

Set Screw Collar Ball Bearings

Slip these bearings onto a shaft and secure with the included set screw, no special tools required. Bearings have an extended inner ring for additional shaft support and a retaining ring that allows for quick positioning. They are made of 52100 steel and come greased. *Double-shielded* bearings have a steel shield and meet ABEC-1 dimensional tolerance standards. Temperature range is -60° to 250° F. *Double-sealed* bearings have a Buna-N rubber seal. Temperature range is -20° to 250° F.

Corrosion-resistant bearings have a black-oxide finish, unless noted.

Angular-Contact Ball Bearings

Open

Double Sealed

Double Shielded

The balls in these bearings are set at an angle to better handle loads from multiple directions. Bearings are 52100 steel. Double-sealed bearings have Buna-N rubber seals.

Single Row—Bearings handle thrust loads in one direction. For applications with thrust loads from both directions, mount them in pairs. They have a 40° contact angle. They come greased. *Open* bearings meet ABEC-3 dimensional tolerance standards, unless noted. Temperature range is -40° to 240° F. *Double-sealed* bearings meet ABEC-1 dimensional tolerance standards. Temperature range is -20° to 230° F.

Double Row—Bearings handle thrust loads in both directions. They have a 30° contact angle. Temperature range is -30° to 240° F. *Open* bearings require lubrication; *double-shielded* and *double-sealed* come greased. *Standard* bearings meet ABEC-1 dimensional tolerance standards. *Premium* bearings meet ABEC-3 dimensional tolerance standards.

Ultra Precision—Commonly found in machine tool spindles, these bearings are made to tight tolerances to perform in high-speed, precision applications. Mount them in pairs to handle thrust loads from both directions. Bearings have a 15° contact angle and meet ABEC-7 dimensional tolerance standards. All bearings are open and have a single-row construction. Lubrication is required. Temperature range is -30° to 140° F.

Double-Row Ball Bearings for Misalignment

A sphere-shaped raceway and two rows of balls allow these bearings to compensate for shaft misalignment. Made of 52100 steel, bearings meet ABEC-1 dimensional tolerance standards. They come greased. Temperature range is -30° to 210°F. *Double-sealed* bearings have Buna-N rubber seals.

Ultra-Thin Ball Bearings

Fit these bearings onto large-diameter hollow shafts to run air and hydraulic lines, electrical wiring, and other components through moving parts. A unique internal construction contacts the balls at four points, enabling the bearings to resist any combination of radial, thrust, and moment (torque-type forces off the radial and thrust planes) loads. Common applications include robotics, index and rotary tables, and packaging equipment. Bearings are 52100 steel and come oiled. They have a 30° contact angle and meet ABEC-1F dimensional tolerance standards. Temperature range is -60° to 250°F.

Tapered-Roller Bearings

Tapered-roller bearings handle both radial (perpendicular to the shaft) and thrust (parallel to the shaft) loads, so you can use them virtually anywhere wheels and shafts turn. They have a two-piece design, which offers easy assembly and more accurate adjustments. Temperature range is -60° to 200° F. *Metric* bearings are designed to meet ISO 355 International Metric Standards.

Corrosion-Resistant Zinc Alloy Steel—These bearings are more corrosion resistant than uncoated steel bearings. They have a zinc-alloy coating that guards against corrosion caused by moisture.

High-Load Steel Spherical-Roller Bearings

Two rows of spherically shaped rollers give these bearings dynamic load carrying capacities up to four times that of comparably sized ball bearings. Also known as rock crusher bearings, they handle heavy shock loads and are commonly used for metal milling machinery, mining and oil field equipment, and in paper mills. All bearings are open, which means they dissipate heat more efficiently than shielded bearings. They have a hole in the outer ring for easy lubrication. Maximum temperature is 390° F.

Needle-Roller Bearings

Needle rollers provide increased load capacity over ball bearings and without an inner race, they're extremely thin and economical. Also known as drawn-cup bearings, the shell is drawn out to form a lip that holds the bearing together. A large grease reservoir means they'll need lubrication less often. Use these steel bearings on hardened and ground shafts. Press fit to install. Temperature range is -10° to 250°F for open bearings; 0° to 210°F for sealed and double-sealed bearings.

Open bearings dissipate heat more efficiently than sealed and double-sealed bearings. **Single-sealed** bearings have a rubber seal on one end that blocks out dirt and preserves lubricants. **Double-sealed** bearings come greased and have rubber seals on both sides. They have better dust resistance than open bearings, but retain the most heat.

High-Precision Needle-Roller Bearings

These precision-ground steel bearings give you higher load capacity, speed, and accuracy than standard needle-roller bearings. They're for use on hardened and ground shafts. If your shaft is not hardened and ground, use these bearings with liners (sold separately). Insert the liner into the bearing and press fit onto a shaft. Bearings have a lubrication groove and hole, unless noted.

Open bearings dissipate heat more efficiently than double-sealed bearings. Temperature range is 0° to 250°F. **Double-sealed bearings** offer better dust resistance than open bearings, but retain the most heat. Temperature range is -30° to 250°F. **Optional liners** are made of hardened and ground steel. *Inch* sizes have a lubrication hole; *metric* sizes do not, unless noted.

★Does not have a lubrication groove or hole. ■ Includes lubrication hole.

One-Way Locking Needle-Roller Bearing Clutches

Also known as drawn-cup roller clutches, these bearings roll freely in one direction, but they lock to transmit torque when the rotation of the shaft is reversed. An arrow on the lip indicates the rotational direction that locks the bearings. These steel bearings do not support loads. To support radial (perpendicular to the shaft) loads, use these bearings with our Needle-Roller Bearings. All are for use on hardened and ground shafts.

Inch—*Standard* bearings have a maximum temperature of 200°F. *High-temperature* bearings have a maximum temperature of 250°F.
Metric—Bearings have a maximum temperature of 150° F.

One-Piece Steel Thrust Ball Bearings

Shaft Mount

For Shaft Ends

No need to mate cage assemblies and washers—these bearings are fastened together, so they're easy to handle and install. Great for heavy duty thrust (parallel to the shaft) loads on pump valves, machine spindles, drilling heads, and rotary and index tables. All bearings are made of hardened steel. Temperature range is -40° to 250° F. Note: Dynamic load capacities listed are for thrust loads.

Shaft Mount—Bearings have an outer band that holds the bearing together and acts as a shield, blocking out dirt and contaminants. The band has an oil hole to facilitate lubrication. Without a ball cage, these bearings hold more balls than standard three-piece thrust bearings.

For Shaft Ends—Use these bearings as miniature high-precision turntables that handle both heavy loads and speeds up to 1,500 rpm. They have a unique design, which allows your shaft to sit on top of the bearing rather than being inserted through it. Bearings can be bonded to a mounting plate or press-fit into a hole.

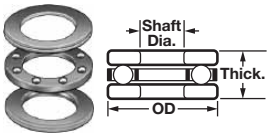
Steel Thrust Ball Bearings



Mount these bearings on a vertical shaft to reduce friction between components. When you don't need high-precision machined bearings, these three-piece bearings are an economical option. Their compact, low-profile design works well in narrow spaces. Bearings include two washers and a plastic cage. The open design allows them to dissipate heat more efficiently than one-piece bearings. Maximum speed is 2,500 rpm. Temperature range is -40° to 220° F. Note: Dynamic load capacities listed are for thrust (parallel to the shaft) loads.

Bearings with steel washers have steel balls and are stronger than bearings with stainless steel washers. *Bearings with stainless steel washers* have stainless steel balls and are more corrosion resistant than bearings with steel washers, but they're not as strong.

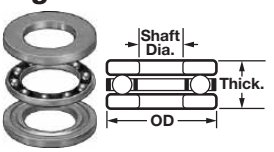
High-Performance Steel Thrust Ball Bearings



These bearings handle higher speeds and loads than standard steel thrust ball bearings. Each three-piece bearing includes two steel washers. Note: Dynamic load capacities listed are for thrust (parallel to the shaft) loads.

High Speed— Bearings are bronze with steel balls. Temperature range is -60° to 250° F.

High Load—Bearings are steel with steel balls, except bearing for 10 mm shaft is plastic. Temperature range is -40° to 240° F.

Steel Thrust Needle-Roller Bearings

Because of the large contact area between the rollers and washers, these bearings are great for medium to heavy duty, low-friction jobs. They are often used with vertical shafts, and their compact, low-profile design works well in narrow spaces. A complete bearing consists of one roller bearing and two washers (sold separately). For an even lower profile, you can use the roller bearings without washers on material that is hardened to Rockwell C58-C64 with a surface finish of 16 microns.

All components are made of steel. Temperature range is -40° to 240°F for inch sizes; 0° to 240°F for metric sizes. Note: Dynamic load capacities listed are for thrust (parallel to the shaft) loads.

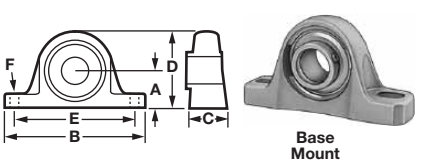
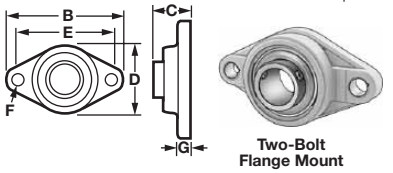
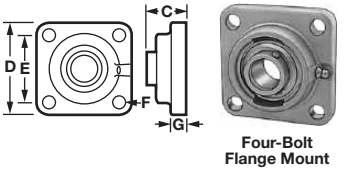
Food-Grade Stainless Steel Mounted Ball Bearings



Base Mount



Two-Bolt Flange Mount



Four-Bolt Flange Mount

The lubricant in these mounted ball bearings meets USDA H1 for incidental contact with food. Bases are solid cast 300 series stainless steel. Ball bearings are made of 420 stainless steel. They're permanently lubricated and double shielded—so they're virtually maintenance free. Shields block out dirt.

All bearings are made to ABEC-1 dimensional tolerance standards. Temperature range is -30° to 160°F. Furnished with two stainless steel set screws to secure the bearing to the shaft.

Cast Iron Mounted Steel Ball Bearings

These rugged cast iron bearings are made to ABEC-1 dimensional tolerance standards. All have a ball bearing insert and are double sealed. Bearings also have a grease fitting for easy lubrication. Bearings are 52100 steel with a cast iron housing. They can accommodate 2° of shaft misalignment.

Bearings with set-screw lock include two set screws to secure the bearing to the shaft. Temperature range is 0° to 220°F for *base-mount* bearings; 0° to 250°F for *two-* and *four-bolt flange-mount* bearings, unless noted.

Bearings with eccentric lock have an off-center shaft opening and collar that wedge against the shaft as it turns—gripping in one direction and releasing in the other. They are easier to install than bearings with a set screw grip and require less adjustment over time. A set screw is included for gripping back-up. Use with shafts that spin in one direction only. Temperature range is 0° to 240°F, unless noted.

Also Available: Replacement ball bearing inserts. Please ask for 6361K888 and specify the part number of the bearing for which you need an insert.

★ Temperature range is -22° to 212°F. ■ Dynamic load capacity is 2,149 lbs. ▲Mounting hole is 35/64".

Nickel-Plated Cast Iron Mounted Steel Ball Bearings

A nickel-plated cast iron housing makes these mounted ball bearings corrosion resistant and extremely durable. The housing also has a grease fitting to simplify lubrication. Great for washdown applications.

All of these bearings are made to ABEC-1 dimensional tolerance standards and accommodate 1.5° of shaft misalignment. Bearing inserts are double sealed to block out dirt and preserve lubricants. Components are 52100 steel. Temperature range is 0° to 210°F, except three-bolt flange-mount bearings have a temperature range of -40° to 220°F. Furnished with two set screws to secure the bearing to the shaft.

Permanently Lubricated Mounted Ball Bearings

With permanent lubrication, these bearings save maintenance time and are perfect for use in hard-to-reach areas. They are made to ABEC-3 dimensional tolerance standards with double-sealed bearings to block out dirt. Bearings come lubricated with USDA H1 grease for incidental contact with food. Furnished with two set screws to secure the bearing to the shaft.

Black oxide 52100 steel bearings with cast iron housing have a temperature range of 10° to 175°F.

440C stainless steel bearings with polyester housing are more corrosion resistant than black oxide 52100 steel bearings. Temperature range is 0° to 200°F.

High-Speed Cast Iron Mounted Steel Ball Bearings

Lubricated with air-handling-quality grease, these bearings stand up to the ultra-high-speed demands of high-speed blowers and fans. A ring-style collar makes a nearly perfect 360° grip around your shaft for a strong, mar-free hold. The collar centers the shaft, decreasing vibration and providing smooth rotation. Bearings include a Torx-head cap screw to secure the bearing to the shaft. All are made to ABEC-1 dimensional tolerance standards. They're double sealed for good resistance to dust and contaminants. Housing is cast iron; bearing is 52100 steel. Temperature range is -40° to 200° F.

High-Temperature Cast Iron Mounted Steel Ball Bearings

High-temperature grease enables these bearings to operate in temperatures up to 400° F, nearly double the temperature of standard mounted ball bearings. They are self-aligning to compensate for 4° of shaft misalignment and are double sealed for excellent resistance to dust and contaminants. A grease fitting in the housing makes adding lubrication easy. Made to ABEC-1 dimensional tolerance standards. Housing is cast iron; bearing components are 52100 steel. Furnished with two set screws to secure the bearing to the shaft.

Also Available: Replacement ball bearing inserts. Please ask for 6667K3 and specify bearing part number.

Vibration-Damping Cast Iron Mounted Steel Ball Bearings

The ring-style collar makes a nearly perfect 360° grip around your shaft for a strong, mar-free hold. The collar centers the shaft, decreasing vibration and providing smooth rotation. All bearings are made to ABEC-1 dimensional tolerance standards. Housing is cast iron and has a grease fitting for easy lubrication. Bearing insert is 52100 steel.

Bearings without Torque Indicator—These bearings are double shielded to block out dirt and accommodate 4° of static shaft misalignment. Temperature range is -20° to 220° F. Furnished with a set screw to secure the bearing to the shaft.

Bearings with Torque Indicator—All are double shielded to block out dirt and accommodate 2° of shaft misalignment. Temperature range is 0° to 230° F. Furnished with three set screws to secure the bearing to the shaft. Simply tighten the set screws and a built-in torque indicator tells you when the bearing is centered.

Self-Aligning Low-Profile Mounted Ball Bearings

Designed with a thin, compact housing, these bearings are good for space constrained, light duty applications. All are made to ABEC-1 dimensional tolerance standards and accommodate 3° of shaft misalignment. Bearing inserts are double sealed to block out dirt and preserve lubricants. Temperature range is 0° to 210° F. Furnished with two set screws to secure the bearing to the shaft.

Steel—Housing is steel. Bearing components are 52100 steel.

Stainless Steel—The choice for corrosion resistance. Housing is stainless steel. Bearing components are 440C stainless steel.

Light Duty Two-Bolt Flange-Mounted Ball Bearings

The closed backing on these bearings makes them good for light duty shaft-end support. Housing is PEEK and bearing components are 440C stainless steel. Temperature range is -140° to 480° F.

Open bearings dissipate heat more efficiently than shielded bearings. **Double-shielded** bearings resist dust and other contaminants, but do not dissipate heat as efficiently as open bearings.

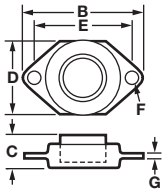
Low-Profile Two-Bolt Flange-Mounted Ball Bearings

Designed with a thin, compact housing, these bearings are good for space constrained applications. They are double sealed for excellent resistance to dust and contaminants. Housing is steel and bearing components are 52100 steel. Maximum temperature is 250° F. Furnished with two set screws to secure the bearing to the shaft.



For Shaft Dia.	Dynamic Load Cap., lbs.	Max. rpm	O'all Lg. (B)	O'all Wd. (C)	O'all Ht. (D)	Ctr.-to-Ctr. (E)	Mounting Hole Size (F)	Flange Thick. (G)

Food-Grade Plastic Mounted Ball Bearings

An excellent choice for food-processing applications, the lubricant in these mounted ball bearings meets USDA H1 for incidental contact with food. A grease fitting in the housing makes lubrication easy. All of these bearings have a smooth, corrosion-resistant plastic housing with double-sealed bearing inserts to block out dirt. Furnished with two set screws to secure the bearing to the shaft.

Zinc-Plated 52100 Steel—These bearings have higher load and speed ratings than stainless steel inserts and accommodate shaft misalignment up to 2°. They're made of coated steel for corrosion resistance and are precision-machined to meet ABEC-1 dimensional tolerance standards. Temperature range is -20° to 160° F for base-mount bearings; -22 to 160° F for flange-mount bearings. **Also Available:** Protective end covers. Please ask for 6736K888 and specify shaft diameter.

303 Stainless Steel—These stainless steel bearings are more corrosion resistant than steel bearings and will accommodate shaft misalignment up to 3°. Temperature range is -25° to 250° F for base-mount bearings; -20° to 250° F for flange-mount bearings. Furnished with protective end covers.

Ultra-Corrosion-Resistant Mounted Ball Bearings

Use these lightweight bearings in corrosive environments and under water. Unlike other mounted ball bearings, they do not require lubrication. Great for use in food and hygienic applications, they have a polyester housing. All are self-aligning, which means they'll compensate for minor shaft misalignment. They are open bearings, which means they run cool. Temperature range is -40° to 180°F in air. In liquid, the maximum temperature is 120°F (not rated for minimum temperature in liquid). Furnished with a set screw to secure the bearing to the shaft.

These bearings are available in acetal or 316 stainless steel. **Acetal** bearings are more economical than 316 stainless steel bearings. **316 stainless steel** bearings handle heavier loads than acetal bearings.

Low-Profile Mounted Ball Bearings

Designed with a thin, compact housing, these bearings are good for space constrained applications. These high-precision bearings have an aluminum housing and 52100 steel ball bearings for excellent corrosion resistance. All are made to tight ABEC-3 dimensional tolerance standards. They come greased and are double shielded to block out dirt. Temperature range is -20° to 240°F.

Bearings with extended inner ring provide additional shaft support.

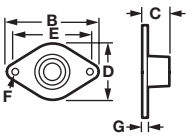
Light Duty Two-Bolt Flange-Mounted Roller Bearings



These bearings handle extremely high speeds for their small size. The self-aligning design compensates for 5° of shaft misalignment.

All bearings are 52100 steel with a black-oxide finish for added corrosion resistance. Bearings are open, which means they run cool and are easy to lubricate. Temperature range is -20° to 210°F.

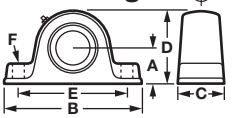
Mounted Roller Bearings



Mounted roller bearings make more contact with the raceway to support at least twice the load of comparable mounted ball and sleeve bearings. A clamp-on collar creates a 360° grip around the shaft for a strong, mar-free hold. The collar centers the shaft, decreasing vibration and providing smooth rotation. All bearings are self-aligning to compensate for up to 1.5° of shaft misalignment and double sealed for excellent resistance to dust and contaminants.

You can mount these bearings in minutes and remove them (even if they're dirty and rusted) with the included hex key. To unmount, loosen two mounting set screws and tighten two dismounting set screws until you hear and feel a pop.

They handle both radial (perpendicular to the shaft) and minimal thrust (parallel to the shaft) loads. Housing is cast iron; bearing insert is 52100 steel and comes lubricated. A grease fitting in the housing makes adding lubrication easy. Temperature range is 0° to 200°F.

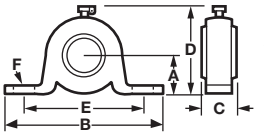
High-Speed Oil-Embedded Mounted Sleeve Bearings



A strong steel housing allows these bearings to run at higher speeds than standard oil-embedded mounted sleeve bearings. Startup friction causes the bearing to release a thin layer of oil on the bearing's surface. Unless noted, these bearings include an oil cup with a reservoir that gradually distributes oil onto the bearing; a self-closing hinged cover keeps out contaminants. Housing is steel; bearing insert is SAE 841 bronze. Temperature range is -40° to 240°F.

Note: Dynamic load capacity is the maximum load a bearing can withstand at a given shaft speed. If the bearing's load and speed are below the values listed, the bearing should work for your application.

★Does not include oil cup.

Aluminum-Mounted Bronze Sleeve Bearings

You get to choose which self-lubricating bearing you want mounted in a lightweight, corrosion-resistant, aluminum housing. All bearings are self-aligning to compensate for up to 5° of shaft misalignment.

Oil Embedded—Startup friction causes these porous bearings to release a thin layer of oil on the bearing's surface. Temperature range is -20° to 200°F.

High-Load Dry Running—The addition of PTFE particles to these bronze bearings increases their load capacity while also making them slippery. Temperature range is -40° to 380°F.

Note: Dynamic load capacity is the maximum load a bearing can withstand at a given shaft speed. If the bearing's load and speed are below the values listed, the bearing should work for your application.

Vibration-Damping Oil-Embedded Mounted Sleeve Bearings

With a flexible layer of neoprene sandwiched between an SAE 841 bronze bearing and rigid steel shell, these bearings absorb vibration to reduce wear and noise. At startup, friction causes the bearing to release a thin layer of oil on the bearing's surface. All bearings are self-aligning to compensate for up to 3° of shaft misalignment. Housing is steel. Temperature range is 0° to 225°F.

Note: Dynamic load capacity is the maximum load a bearing can withstand at a given shaft speed. If the bearing's load and speed are below the values listed, the bearing should work for your application.

Light Duty Dry-Running Two-Bolt Flange-Mounted Sleeve Bearings

Use these nylon bearings in lightweight applications. They have a fairly slippery bearing surface, which does not require lubrication when used for light duty applications. The closed backing provides shaft-end support. Temperature range is -20° to 250°F.

Note: Dynamic load capacity is the maximum load a bearing can withstand at a given shaft speed. If the bearing's load and speed are below the values listed, the bearing should work for your application.

Extreme-Temperature Dry-Running Mounted Sleeve Bearings

Capable of handling temperatures from -400° to 750°F, these bearings have the widest temperature range of any of our mounted bearings. Use them in corrosive environments and under water. They are self-aligning to compensate for 3° of shaft misalignment. Bearing inserts consist of solid graphalloy bushings that have been pressed into cast iron housings—so they stay slick their entire service life.

Note: Dynamic load capacity is the maximum load a bearing can withstand at a given shaft speed. If the bearing's load and speed are below the values listed, the bearing should work for your application.

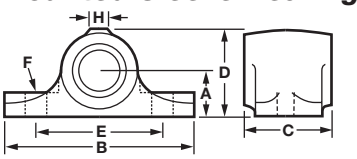
Cast Iron Babbitt-Lined Mounted Sleeve Bearings

Solid

Split



A reliable classic—these babbitt-lined bearings are strong and corrosion resistant. The housing is cast iron and has a hole with NPT female threads for lubrication. Temperature range is 0° to 130°F. **Split** bearings have a removable section for easy maintenance.

Note: Dynamic load capacity is the maximum load a bearing can withstand at a given shaft speed. If the bearing's load and speed are below the values listed, the bearing should work for your application.

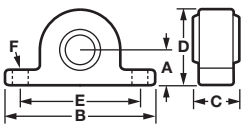
Dry-Running Mounted Sleeve Bearings for Extreme Misalignment



To accommodate extreme cases of shaft misalignment, these bearings have a nylon bearing insert that swivels. Bearings are 80% lighter than steel and resistant to corrosion, wear, shock, and vibration. Temperature range is -40° to 170°F.

Note: Dynamic load capacity is the maximum load a bearing can withstand at a given shaft speed. If the bearing's load and speed are below the values listed, the bearing should work for your application.

Mounted Plastic Sleeve Bearings

Use these bearings in wet, corrosive environments.

Corrosion Resistant—Temperature range is -200° to 180° F. *UHMW bearings* are made of a single UHMW polyethylene block. They have good vibration-damping qualities. *UHMW bearings with stainless steel housing* can compensate for up to 3° of shaft misalignment.

Food Grade—Made of FDA-listed PEEK, these bearings are suitable for contact with food. They also have good chemical compatibility. Bearings have a closed back for use with shaft ends. Temperature range is -140° to 480° F.

Note: Dynamic load capacity is the maximum load a bearing can withstand at a given shaft speed. If the bearing's load and speed are below the values listed, the bearing should work for your application.

Ball Bearing Shim Rings

Also called tolerance rings, these Type 301 stainless steel rings are for use in your stamped, molded, or worn housings to form a tight hold on your bearings. They operate like a spring, compressing and expanding, creating tension between the bearing and the housing to hold your bearing in place. Rings reduce vibration and compensate for some thermal expansion between the housing and the bearing. They eliminate the need for keys, pins, and adhesives. Rings are 0.008" to 0.020" (0.2032 to 0.508 mm) thick with corrugations from 0.0295" to 0.0492" (0.7493 to 1.2497 mm) high and allow for 0.5° of misalignment.

Bearing Heaters

About Bearing Heaters

Heating your bearings makes them easier to install and reduces damage to your shafts during installation. The heaters work by expanding your bearing's inner race, so you get a snug fit without forcing a tight-fitting bearing onto a shaft. Heaters can also be used on gears, sprockets, pulleys, and bushings. ***Induction bearing heaters*** will not magnetize heated items.

Cone-Mount Bearing Heaters

Automatic (Shown w/Bearing)

For fast, even heat transfer, these heaters boast a cone-shape design. The cone is aluminum and the base is chrome-plated steel, unless noted. Heaters operate on 120 VAC, 60 Hz and have a heating time of 2 to 30 minutes. Furnished with an on/off switch and an 8-ft. power cord with three-prong plug. All are UL Listed, unless noted.

Manual heaters include a temperature-indicating crayon. The crayon mark melts when bearing reaches 250° F with ±25° F accuracy.

Automatic heaters include a thermostat that automatically brings the temperature up to 250° F with ±25° F accuracy.

Bearing ID Range	Watts	Ht. × Wd.		Each
Manual Heaters				
3/8″- 5 3/4″	725	10″ × 10″	6519K11	$496.92
3/4″- 5 3/4″	725	10″ × 10″	6519K17	550.62
Automatic Heaters				
3/4″- 8″	725	10″ × 10″	6519K19	780.43
5 1/2″-18″	1450	14″ × 21″	6519K21●	1,322.19

● Base is aluminum. Not UL Listed.

Ultra-Portable Miniature Induction Bearing Heater

Shaped like a large flashlight, this 2 1/2″ OD × 15″ Lg. induction-style heater easily fits in your hand to go where you go. It's perfect for use on bearings that are up to 2″ ID and 3″ OD. The heater housing is made of plastic.

Heater operates on 120 VAC, 50/60 Hz and includes three heating coils to handle a variety of heating jobs. It also has a thermal switch for thermal overload protection. Furnished with a 6-ft. power cord with three-prong plug and a plastic carrying case.

This heater can also be used on stubborn and rusted nuts. It is not rated for temperature. Demagnetization is not necessary after heating.

6083K11 ..... **Each** $517.48

Portable Digital Induction Bearing Heater

Take this completely portable heater anywhere it's needed. It has a heat clamp with a 2″ × 2″ opening to hold bearings that are 2″ wide and smaller with a 0.8″ to 4″ ID. The clamp is iron encased in phenolic plastic.

Heater operates on 110 or 240 VAC, 50/60 Hz and has a temperature range of 32° to 392° F with ±6° F accuracy. It has a time control that lets you vary the heating time from 0 to 60 minutes to prevent overheating. Furnished with a 6.6-ft. power cord (plug not included, see pages 816-822), temperature probe, heat-resistant gloves, and a padded carrying case with shoulder strap. Demagnetization is not necessary after heating.

5208A6 ..... **Each** $2,343.73

Hot-Plate Bearing Heater

An aluminum heating plate uniformly heats the top and bottom of your bearings. It adjusts to fit bearings up to 2″ thick and can heat more than one bearing at a time. The plate is housed in a 5″ Ht. × 16″ Wd. × 10″ Dp. metal case that minimizes heat loss and prevents dirt from entering your bearings.

Heater includes a thermostat that adjusts from 120° to 390° F with ±18° F accuracy. The thermostat has an automatic shut-off in case of thermostat failure. Heater operates on 115 VAC, 50/60 Hz and is rated to 1000 watts. Furnished with a 6.6-ft. power cord (plug not included, see pages 816-822). Demagnetization is not necessary after heating.

6503K45 ..... **Each** $1,199.49

Fast-Heating Digital Induction Bearing Heater

Heat a 60-lb. bearing in just 20 minutes. This fast-heating induction style heater comes with three sizes of steel crossbars (0.5″, 1.1″, and 1.7″ sq.) that hold bearings with a 0.8″ to 11.8″ ID. Maximum bearing weight is 88 lbs.

Heater operates on 110 VAC, 50/60 Hz and has a temperature range of 32° to 482° F with ±3.6° F accuracy. It automatically demagnetizes bearings after heating and includes a temperature probe, 0- to 60-minute time control, circuit breaker with over-current protection, and automatic over-heating protection.

Heater housing is steel and glass-filled polyamide. It measures 8.2″ Ht. × 17.7″ Wd. × 7.6″ Dp. Furnished with a 4.6-ft. power cord with a NEMA 5-20 plug.

7167K11 ..... **Each** $2,787.92

Crossbar Induction Bearing Heaters

These induction-style heaters have laminated steel crossbars to handle a wide range of bearing ODs and widths. They heat most bearings in 2 to 20 minutes.

The heaters include two sizes of crossbars. The crossbar size determines the bearing ID that can be accommodated (see listing for sizes). For the fastest heating, use the largest crossbar that fits through your bearing. The maximum heating temperature is 250° F. Temperature-indicating crayons are recommended (not included; see 3261K on page 619).

Heaters have an on/off switch, a grounded outer case, and 6-ft. long three-wire power cord. Model 6174K63 has a NEMA 5-20 plug (see page 820 for plug configurations); models 6174K64 and K66 do not have a plug and must be hardwired. Heaters can be used for demagnetizing.

Max. Bearing OD	Wd.	Crossbar Sizes (sq.)	Voltage @ 60 Hz	O'all Size, Ht. × Wd.		Each
11″	4″	3/4″, 2″	110 VAC	9 3/4″ × 11 1/4″	6174K63	$1,453.60
22″	8″	1 1/4″, 3″	220 VAC	17 1/4″ × 17 1/4″	6174K64	2,909.52
22″	12 1/4″	1 1/4″, 3″	440 VAC	17 1/4″ × 21 3/4″	6174K66	3,213.69

Accessories

Riser Blocks — Use these blocks to lift bearing heater crossbars to accommodate larger diameter bearings for heaters listed above.

For Heater	Maximum Bearing OD	Block Size, Lg. × Wd. × Ht.		Per Pair
6174K63	14″	2 5/8″ × 2 5/8″ × 2 3/8″	6174K71	$281.76
6174K64 and 6174K66	32″	3 5/8″ × 3 5/8″ × 5″	6174K72	363.19

About Shaft Collars

Set Screw

One-Piece Clamp-On

Two-Piece Clamp-On

Hinged One-Piece Clamp-On

Shaft collars are useful for holding and positioning components on a shaft. They can also serve as mechanical stops and stroke limiters. When choosing a shaft collar, make sure the collar material is the same as your shaft material. There are four main styles of shaft collars:

Set Screw—Slide collar onto an unhardened shaft and tighten the included set screw, which bites into the shaft for a tight hold.

One-Piece Clamp-On—Slide collar onto a shaft and secure it in place with one screw (included). Collars clamp evenly around the shaft to provide more holding power than set screw shaft collars, plus they won't mar the shaft.

Two-Piece Clamp-On—These come apart so you can install and remove them from a shaft without having to remove other components. They're also good for applications where you don't have access to the end of a shaft. Position collar on a shaft and secure it in place with two screws (included). Collars clamp evenly around the shaft to provide superior holding power, plus they won't mar the shaft.

Hinged One-Piece Clamp-On—You'll get the benefits of a two-piece collar in a one-piece design. Swing collar open, position and close it on a shaft, and then secure it in place with one screw. The screw is captive so it won't fall out, making these collars good for use in tight areas where you can't hold the screw in place. These collars clamp evenly around the shaft to provide superior holding power, plus they won't mar the shaft.

Set Screw Shaft Collars

Slide a collar onto your shaft and tighten the hex-socket set screw, which bites into the shaft for a tight hold.

Black-oxide steel offers some corrosion resistance. **Zinc-plated steel** offers better corrosion resistance than black-oxide steel. **Aluminum** is lightweight with good corrosion resistance. **Type 303 stainless steel** offers excellent corrosion resistance. **Type 316 stainless steel** offers superior corrosion and chemical resistance. **Brass** is spark resistant. **Nylon** is excellent for food-processing applications. Color is white. Collars are USDA compliant, made from FDA-compliant resins, and meet 3-A sanitary standard requirements. **Sintered steel** is made from powdered metal and is much lighter than other steel collars.

Set Screw Shaft Collars *(Continued from previous page)*

Slide a collar onto your shaft and tighten the hex-socket set screw, which bites into the shaft for a tight hold.
Black-oxide steel offers some corrosion resistance. **Zinc-plated steel** offers better corrosion resistance than black-oxide steel. **Aluminum** is lightweight with good corrosion resistance. **Type 303 stainless steel** offers excellent corrosion resistance. **Type 316 stainless steel** offers superior corrosion and chemical resistance. **Brass** is spark resistant. **Nylon** is excellent for food-processing applications. Color is white. Collars are USDA compliant, made from FDA-compliant resins, and meet 3-A sanitary standard requirements. **Sintered steel** is made from powdered metal and is much lighter than other steel collars.

Two-Piece Clamp-On Shaft Collars

Able to come apart, you can install these collars anywhere on a shaft without removing components. They clamp evenly around your shaft for superior holding power without marring the shaft. Tighten the two socket-head cap screws to secure.

Black-oxide steel offers some corrosion resistance. **Zinc-plated steel** offers better corrosion resistance than black-oxide steel. **Aluminum** is lightweight with good corrosion resistance. **Type 303 stainless steel** offers excellent corrosion resistance. **Type 316 stainless steel** offers superior corrosion and chemical resistance. **Chrome-plated steel** has the strength and corrosion resistance of zinc-plated steel with a bright finish. **Nylon** is a lower cost alternative to stainless steel. Color is white. **Delrin® acetal resin** offers good chemical resistance and is suitable for washdown applications. Color is white.

Metric Two-Piece Clamp-On Shaft Collars

The two-piece design means you can install these collars anywhere on a shaft without removing components. They clamp evenly around your metric shaft for superior holding power without marring the shaft. Tighten the two socket-head cap screws to secure.

Black-oxide steel offers some corrosion resistance. **Aluminum** is lightweight with good corrosion resistance. **Type 303 stainless steel** offers excellent corrosion resistance. **Type 316 stainless steel** offers superior corrosion and chemical resistance.

Two-Piece Clamp-On Shaft Collars with Keyway

With an ANSI keyway and their two-piece design, you can install these collars anywhere on a keyed shaft without removing components. They clamp evenly around your shaft for superior holding power without marring the shaft. Tighten the two socket-head cap screws to secure. For keyed shafts, see pages 1130-1132. For keys and key stock, see pages 3400-3403.

Black-oxide steel offers some corrosion resistance. **Aluminum** is lightweight with good corrosion resistance. **Type 303 stainless steel** offers excellent corrosion resistance.

Clamp-On Shaft Collars with Mounting Holes

Face-Mount One-Piece Collars

Flanged One-Piece Collars

Adapter Ring for Black-Oxide Steel Flanged Collars

Top- and Bottom-Mount Two-Piece Collars

Mounting holes allow you to fasten gears, pulleys, and sprockets to the collar without welding. All collars clamp on.

Black-oxide steel offers some corrosion resistance. **Aluminum** is lightweight with good corrosion resistance. **Type 303 stainless steel** offers excellent corrosion resistance.

Face-Mount One-Piece Collars—Have two tapped holes in the collar face. Slide the collar onto your shaft and tighten the socket-head cap screw to secure.

Flanged One-Piece Collars—Have three tapped counterbored holes and three through holes for mounting flexibility. They also have a standard ANSI keyway, unless noted (for keyed shafts, see pages 1130-1132; for keys and key stock, see pages 3400-3403). Slide the collar onto your shaft and tighten the two socket-head cap screws to secure.

Adapter rings extend the flange OD of the collars to handle larger components. All are machinable, weldable grade 1018 steel with three through holes that mate to the flanged mounting holes of the black-oxide steel flanged one-piece collars.

Top- and Bottom-Mount Two-Piece Collars—Have one tapped hole on each flat side of the collar and include screws to fasten items. You can install these collars anywhere on a shaft without removing components. Tighten the two socket-head cap screws to secure.

Hinged One-Piece Clamp-On Shaft Collars

You'll get the benefits of a two-piece collar in a one-piece design. Swing collar open, position and close it anywhere on your shaft, and tighten the socket-head cap screw to secure. The screw is captive so it won't fall out, making these collars good for use in tight areas where you can't hold the screw in place. Collars clamp evenly around your shaft for superior holding power without marring the shaft.

Black-oxide steel offers some corrosion resistance. **Type 303 stainless steel** offers excellent corrosion resistance.

Weldable Clamp-On Shaft Collars

One-Piece Two-Piece

Because these collars are grade 1018 steel, you can easily weld them to other components. All are clamp-on style for excellent holding power without marring your shaft.

One-piece collars slide onto your shaft and secure with one socket-head cap screw. **Two-piece** collars can be installed anywhere on a shaft without removing components. Tighten the two socket-head cap screws to secure.

Machinable-Face One-Piece Clamp-On Shaft Collars

These collars have two different sides—one locks down like a standard one-piece shaft collar; the other has a flush face that you can machine to add slots, holes, and grooves to match your special setups. Collars are black-oxide steel and offer some corrosion resistance. All are clamp-on style for excellent holding power without marring your shaft. Slide collar onto your shaft and secure with the two socket-head cap screws.

One-Piece Clamp-On Shaft Collars with Precision-Ground Face

One side of these collars locks down like a standard one-piece shaft collar; the other has a flush face that's flat to 0.0005", which lets you mount the collars on a shaft next to precision bearings, sprockets, and gears. Collars are black-oxide steel and offer some corrosion resistance. All are clamp-on style for excellent holding power without marring your shaft. Slide collar onto your shaft and secure with the two socket-head cap screws.

Machinable-Bore Clamp-On Shaft Collars

One-Piece

Two-Piece

You can machine the bore of these collars to precisely fit your odd-sized shaft. Collars are black-oxide steel and offer some corrosion resistance. All are clamp-on style for excellent holding power without marring your shaft.

One-piece collars slide onto your shaft and secure with one hex socket cap screw. **Two-piece** collars can be installed anywhere on a shaft without removing components. Tighten the two hex socket cap screws to secure.

Hexagonal-Bore Clamp-On Shaft Collars

The perfect fit for hexagon-shaped shafts. All collars are clamp-on style for excellent holding power without marring your shaft.

Black-oxide steel offers some corrosion resistance. **Type 303 stainless steel** offers excellent corrosion resistance.

One-Piece—Slide onto your shaft and secure with one socket-head cap screw.

Two-Piece—Come apart in two and can be installed anywhere on a shaft without removing components. Tighten the two socket-head cap screws to secure.

Acme Threaded-Bore Clamp-On Collars

Specially designed to fit Standard-Travel Precision Acme Threaded Rods (page 1155) and General Purpose Acme Rods (pages 3202-3204), all collars are standard travel (single start) with a speed ratio of 1:1. They have right-hand threads and are made of black-oxide steel for some corrosion resistance. Thread collar onto your shaft and tighten the clamp screw to secure.

Easy-Shaft-Adjust Two-Piece Clamp-On Shaft Collars

Wrench flats allow you to rotate your drive shaft without marring or gouging the shaft. Fasten one of these collars onto your shaft, position a wrench on the collar's wrench flats, and then rotate the entire shaft/collar assembly to adjust the shaft. You can install these collars anywhere on a shaft without removing components. Tighten the two socket-head cap screws to secure.

Black-oxide steel offers some corrosion resistance. **Aluminum** is lightweight with good corrosion resistance. **Type 303 stainless steel** offers excellent corrosion resistance.

Adjustable-Width Clamp-On Shaft Collars

Adjustable Width

Ultra-Precision Adjustable Width

Precisely adjust the width of these collars to set the stroke length of a linear sliding guide rod or shaft. To use, slide a collar onto your shaft and tighten the socket-head cap screws on one side to secure. Then rotate the knurled sides to make width adjustments and tighten the socket-head cap screws on the other side to lock the collar in place.

Black-oxide steel offers some corrosion resistance. **Type 303 stainless steel** offers excellent corrosion resistance.

Adjustable-Width Collars—Have one knurled side that provides width adjustments of 13/64" to 7/16". There are two cap screws on the smooth side and one on the knurled side.

Ultra-Precision Adjustable-Width Collars—Have two knurled sides that provide micrometer-like movement for even more precise width adjustments of 3/8" to 3/4". They also have 40-pitch threads that provide 0.025" of travel per turn. There are two cap screws on each knurled side.

Extra-Wide Clamp-On Shaft Collars

One-Piece

Two-Piece

Wider than standard shaft collars with twice the number of socket-head cap screws, these ensure a better grip for greater holding power.

Black-oxide steel offers some corrosion resistance. **Aluminum** is lightweight with good corrosion resistance. **Type 303 stainless steel** offers excellent corrosion resistance.

One-Piece—Slide onto your shaft and secure with two cap screws.

Two-Piece—Can be installed anywhere on a shaft without removing components. Tighten the four cap screws to secure.

Extra-Grip Clamp-On Shaft Collars

One-Piece

Two-Piece

The socket-head cap screws are larger than those found on standard clamp-on collars to provide a stronger grip on your shaft. All collars are black-oxide steel, which offers some corrosion resistance.

One-Piece—Slide onto your shaft and secure with one socket-head cap screw.

Two-Piece—Can be installed anywhere on a shaft without removing components. Tighten the two socket-head cap screws to secure.

Ultra-Grip Shaft Collars

An embedded sleeve squeezes your shaft as you tighten the multiple socket-head cap screws to ensure a superior grip on your shaft. These collars handle up to three times the thrust loads of standard collars. All are black-oxide steel, which offers some corrosion resistance.

For Shaft Dia.	OD	Wd.		
3/4"	2 1/4"	1 1/2"	9665T1	$85.44

2 1/2"	5"	1 3/4"	9665T8	151.20

Easy-Install Set Screw Shaft Collars

A two-piece design lets you install these collars anywhere on an unhardened shaft without removing components. Tighten the two socket-head cap screws to secure, then tighten the set screw to bite into your shaft for a secure hold. Collars are black-oxide steel.

For Shaft Dia.	OD	Wd.

Quick-Release One-Piece Clamp-On Shaft Collars

Installing and removing a collar is as easy as pushing down and lifting up a clamp lever. All are one-piece clamp-on style and have a socket-head cap screw to adjust lever tension. Collars and lever are anodized aluminum, which means they are lightweight with good corrosion resistance.

To Order: Please specify shaft diameter.

Available Sizes For Shaft Dia.	OD	Wd.		
3/8", 1/2", 5/8"	1.5"	0.4"	1511K1	$22.17
3/4", 1", 1 1/8"	2"	0.5"	1511K2	29.60
1 1/4", 1 3/8", 1 1/2"	3"	0.6"	1511K3	44.31

Balanced One-Piece Clamp-On Shaft Collars

Formed to offset the weight of the socket-head cap screw, collars won't wobble or vibrate when shafts are spinning—even at high speeds. Slide a collar onto your shaft and tighten the socket-head cap screw to secure.

Black-oxide steel offers some corrosion resistance. **Type 303 stainless steel** offers excellent corrosion resistance.

For Shaft Dia.	O'all Lg.	Wd.	Black-Oxide Steel		Type 303 Stainless Steel

Quick-Release Handles for Shaft Collars

If you frequently move collars along shafts, you'll no longer have to search for a wrench to adjust them. Use one of these knurled handles to replace your collar's socket-head cap screw. The handle keeps your collar secure on the shaft, then lets you loosen and tighten the collar for quick adjustments.

Black-oxide steel offers some corrosion resistance. **Type 303 stainless steel** offers excellent corrosion resistance.

Screw Size	Screw Lg.	O'all Lg.	Handle Dia.	Black-Oxide Steel		Type 303 Stainless Steel

Quick-Connect One-Piece Shaft Collars

Internal ball bearings allow you to slide a collar onto your shaft in one direction and then automatically lock the collar in place in the opposite direction. To adjust or remove, squeeze the end ring in to release the hold.

Zinc-plated steel offers some corrosion resistance. Ball bearings are Type 440C stainless steel. **Type 303 stainless steel** offers excellent corrosion resistance. Ball bearings are Type 440C stainless steel. **ABS plastic** is durable, lightweight, and corrosion resistant. Ball bearings are tungsten carbide.

Bearing Locknut Shaft Collars

In addition to fine threads, which provide close engagement on your shaft, collars have a flexible lining that hugs your shaft to lock your bearing in place. They help eliminate the looseness commonly associated with locknuts that use keyways and lock washers, which are not required with these collars. They also allow precise positioning and better squareness of the retaining ring to the bearing face to hold bearings in place. All collars work with SAE, ABEC, and ANSI/ABMA standard products.

Type 303 stainless steel offers excellent corrosion resistance.

About Shaft Couplings

Couplings connect two shafts and transfer motion from one to the other. There are two types of couplings: rigid and flexible.

Rigid couplings connect two shafts that are aligned. They are also good for handling high-torque applications.

Flexible couplings connect two shafts that are misaligned. Use the chart below as a guide to select the right coupling for your application. For actual performance ratings, please see the individual products. For applications that need to handle higher misalignment than what is listed below, see U-joints (pages 1243-1245).

Make Sure the Couplings You Have Selected Can Handle Your Torque and RPM Requirements

Couplings are rated by maximum torque and maximum rpm. Use this formula to determine the maximum torque you need:

$$\text{Max. Torque (in.-lbs.)} = \frac{\text{hp} \times 63{,}000}{\text{rpm}}$$

Set Screw Rigid Shaft Couplings CAD

Without Keyway

Slide a coupling onto your shafts and tighten the two set screws, which bite into the shafts for a tight hold. When used with a key on a keyed shaft, couplings *with keyway* provide a more secure hold. They have standard ANSI keyway dimensions.

Black-oxide steel offers some corrosion resistance. Max. rpm is 3,450 for shaft dia. up to 3/4″; 1,740 for all others. **Aluminum** is lightweight with good corrosion resistance. Max. rpm is 2,025 for shaft dia. up to 3/4″; 1,020 for all others. **Type 303 stainless steel** offers excellent corrosion resistance. Max. rpm is 3,450 for shaft dia. up to 3/4″; 1,740 for all others.

Also Available: Metric sizes of black-oxide steel and Type 303 stainless steel couplings. Please ask for 5395T888 and specify black-oxide steel or Type 303 stainless steel, for shaft diameter, and with or without ISO-DIN keyway.

One-Piece Clamp-On Rigid Shaft Couplings

Designed to grip evenly around shafts, clamp-on couplings provide more holding power than set screw shaft couplings without marring the shafts. Slide a coupling onto your shafts and tighten the four socket-head cap screws to secure. When used with a key on a keyed shaft, couplings *with keyway* provide a more secure hold. They have standard ANSI inch or ISO-DIN metric keyway dimensions.

Type 303 stainless steel offers excellent corrosion resistance.

Machinable-Bore One-Piece Clamp-On Rigid Shaft Couplings

One end (A) has a finished shaft diameter size; the other (B) can be machined to any size up to the size of (A). Couplings are steel and are not rated for maximum rpm. All are clamp-on style for excellent holding power without marring your shafts. Slide a coupling onto your shafts and tighten the four socket-head cap screws to secure.

Extra-Long Two-Piece Clamp-On Rigid Shaft Couplings

When your shafts are not close enough to use standard couplings, these have the length to bridge the gap. Couplings are cast iron and have a keyway with standard ANSI keyway dimensions (unless noted) to provide a more secure hold on keyed shafts. Couplings have a two-piece design, which offers superior holding power without marring your shaft. Tighten the six bolts (unless noted) to secure.

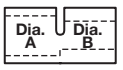
■ Has four bolts. ▲Keyway for 1 3/8" shaft dia. is 3/8" Wd. x 3/16" Dp.

Two-Piece Clamp-On Rigid Shaft Couplings

With Keyway



The two-piece design offers superior holding power without marring your shafts. Tighten the eight socket-head cap screws to secure. When used with a key on a keyed shaft, couplings *with keyway* provide a more secure hold. They have standard ANSI inch or ISO-DIN metric keyway dimensions.

Type 303 stainless steel offers excellent corrosion resistance.

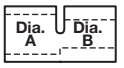
★ Diameter (B) does not have a keyway.

Light Duty Two-Piece Clamp-On Rigid Shaft Couplings



Light in weight with good corrosion resistance, couplings are made of aluminum. All have a two-piece design, which offers superior holding power without marring your shafts. Tighten the four socket-head cap screws to secure.

Available Size Combinations For Shaft Dia. (A) × For Shaft Dia. (B)	Lg.	OD	Max. rpm	Max. Torque, in.-lbs.

High-Grip Clamp-On Rigid Shaft Couplings

One-Piece With Keyway

Two-Piece Without Keyway

With the gripping strength to handle higher torque than most other rigid couplings, these are great for maintaining shaft alignment. All are made of steel.

When used with a key on a keyed shaft, couplings **with keyway** provide a more secure hold. They have standard ANSI keyway dimensions. Couplings **without keyway** have more screws for a secure hold.

One-Piece—Slide onto your shafts and secure with socket-head cap screws (four on couplings with keyway; six on couplings without keyway).

Two-Piece—Offer superior holding power without marring your shafts. Tighten the socket-head cap screws to secure (six on couplings with keyway; 12 on couplings without keyway).

Replaceable-Center Flexible Shaft Couplings

Also known as Lovejoy couplings, these have a spider-shaped cushion between two hubs to reduce shock and handle minor shaft misalignment.

Standard

To create a complete coupling, order two coupling hubs and one spider from the same line in the listing below.

Iron and **Type 303 stainless steel coupling hubs** fasten to your shafts with an included set screw, which bites into your shafts for a tight hold. Hubs with a shaft dia. size of 1/2" and above as well as all metric sizes have a keyway (unless noted) that, when used with a key on a keyed shaft, provides a more secure hold. They have standard ANSI or ISO-DIN keyway dimensions. *Type 303 stainless steel hubs* offer excellent corrosion resistance.

Aluminum coupling hubs are lightweight with good corrosion resistance. They fasten onto your shafts for superior holding power without damaging them. Tighten the socket-head cap screws to secure.

Buna-N spiders provide good vibration damping and chemical resistance. They handle parallel misalignment up to 0.015"; angular misalignment up to 1°. Temp. range is –40° to 212° F.

Hytrel spiders provide fair vibration damping and excellent chemical resistance. They handle parallel misalignment up to 0.015" (unless noted); angular misalignment up to 1/2° (unless noted). Temp. range is –55° to 245° F.

Urethane spiders provide fair vibration damping and good chemical resistance. They handle parallel misalignment up to 0.015" (unless noted); angular misalignment up to 1°. Temp. range is –30° to 160° F.

★ Coupling hub for 5/8" shaft dia. does not have a keyway. ■ Spider has a solid center.
▲ Handles parallel misalignment up to 0.002"; angular misalignment up to 0.8°. ♣ Handles parallel misalignment up to 0.004".

Quick Install

Installing and replacing split spiders is quicker and easier than standard spiders—there's no need for tools or removing your hubs. To create a complete coupling, order two standard coupling hubs (shown above) and then add one split spider and one retaining ring that will fit the OD of the hubs you have selected.

Split spiders are urethane and provide fair vibration damping and good chemical resistance. They handle parallel misalignment up to 0.03"; angular misalignment up to 2°. Temp. range is –30° to 200° F.

Retaining rings twist-lock the split spider in place. They are Type 347 stainless steel for excellent corrosion resistance.

B-B	1"	0.877"	E	1 3/4"	1.506"

Splined coupling hubs fit snugly onto splined shafts that are often found in hydraulic motor and pump applications, while a spider-shaped cushion reduces shock and compensates for minor shaft misalignment. To create a complete coupling, order two coupling hubs and one spider from the same line in the listing below.

Coupling hubs have splines with a 1/2" pitch and 30° pressure angle. Hubs are cast iron and fasten onto your shafts for superior holding power without damaging them. Tighten the socket-head cap screws to secure.

Buna-N spiders provide good vibration damping and chemical resistance. They handle parallel misalignment up to 0.015"; angular misalignment up to 1°. Temperature range is –40° to 212° F.

Hytrel spiders provide fair vibration damping and excellent chemical resistance. They handle parallel misalignment up to 0.015"; angular misalignment up to 1/2°. Temperature range is –55° to 245° F.

Urethane spiders provide fair vibration damping and good chemical resistance. They handle parallel misalignment up to 0.015"; angular misalignment up to 1°. Temperature range is –30° to 160° F.

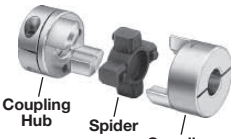
Zero-Backlash Replaceable-Center Flexible Shaft Couplings

Components of a Coupling Shown Assembled



Good for positioning applications, including NC-axes systems and actuators, these couplings allow zero backlash (no play). They consist of a spider-shaped cushion that fits between two coupling hubs to reduce shock and compensate for minor shaft misalignment. To create a complete coupling, order two coupling hubs and one spider from the same line in the listing below.

Coupling hubs are lightweight and corrosion resistant. Metric sizes 10 mm and above have a keyway that, when used with a key on a keyed shaft, provides a more secure hold. They have standard ISO-DIN keyway dimensions.

Aluminum hubs fasten onto your shafts for superior holding power without damaging them. Tighten the socket-head cap screws to secure. *Thermoplastic hubs* are glass fiber reinforced and slide onto your shafts. Tighten the set screws, which bite into the shafts for a tight hold.

Spiders are urethane for fair vibration damping and good chemical resistance. They handle 0.003"-0.011" of parallel misalignment and 0.8° of angular misalignment (except Shore 98A spiders for thermoplastic hubs can handle 1° of angular misalignment and Shore 80A spiders can handle 1.2° of angular misalignment). Temperature range is –4° to 180° F.

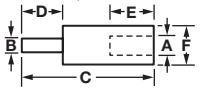
Shaft Adapters



Convert your shaft from one size to another while also extending it. One side of the adapter has a two-piece coupling connection that clamps onto the end of your shaft; the other provides the converted shaft size. All adapters are black-oxide steel, which offers some corrosion resistance. They are not rated for maximum rpm or torque. Tighten the four cap screws to secure.

Step-up adapters make your shaft larger. **Step-down adapters** make your shaft smaller.

Replaceable-Center Slotted-Disc Flexible Shaft Couplings

Also known as Oldham couplings, these couplings have a slotted disc that allows hubs to slide independently, which is especially good for applications with parallel shaft misalignment. They also allow zero backlash (no play) and never need lubrication. Maximum rpm is 4,500. To create a complete coupling, order two coupling hubs and one disc from the same line in the listing below.

Set Screw Couplings—Fasten to your shafts with one or two set screws, which bite into the shafts for a tight hold.

Clamp-On Couplings—Fasten onto your shafts for superior holding power without damaging them. Tighten the two socket-head cap screws to secure.

Coupling hubs are made of lightweight, corrosion-resistant aluminum.

Acetal discs stand up to high twisting forces. Temperature range is –10° to 150° F.

Nylon discs have excellent vibration and shock absorption. Temperature range is –10° to 130° F.

High-Misalignment Replaceable-Center Flexible Shaft Couplings

Also known as Schmidt couplings, these handle higher angular misalignment than other replaceable-center couplings. They allow zero backlash (no play) and never need lubrication. To create a complete coupling, order two hubs and one disc from the same line in the listing below.

Coupling hubs are made of lightweight, corrosion-resistant aluminum. They fasten onto your shafts for superior holding power without damaging them. Tighten the two socket-head cap screws to secure. Inch-size hubs with a shaft diameter of 1/2" and above have a keyway, which provides a more secure hold on keyed shafts. They have standard ANSI keyway dimensions.

Discs are made of acetal. Temperature range is –40° to 170° F.

Servomotor Flexible Shaft Couplings

Able to handle high twisting forces as well as misalignment with zero backlash (no play), these are the choice for high-performance servomotor applications. Couplings are aluminum and Type 304 stainless steel for corrosion resistance. They fasten onto your shafts for superior holding power without damaging them. Tighten the two socket-head cap screws to secure.

Noncontact Magnetic Set-Screw Shaft Couplings

Magnetic force transfers torque from one half of these couplings to the other; there's no contact between the parts so the parts won't wear. Each half (sold separately) contains strong, opposing rare-earth magnets. Couplings are made of 400 series stainless steel; magnets are nickel plated.

To form a complete coupling, order two halves from the same line in the listing below.

Shown with Two Halves

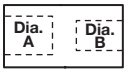
Helical Flexible Shaft Couplings

Clamp On



Cuts in the coupling body allow flexibility to handle shaft misalignment. Good for applications with frequent starts and stops, these couplings allow zero backlash (no play) and never need lubrication.

Aluminum couplings are lightweight with good corrosion resistance. *Inch-to-inch sizes* have a maximum rpm of 10,000. *Metric-to-metric* and *metric-to-inch sizes* have a maximum rpm of 6,000. **Type 303 stainless steel couplings** offer excellent corrosion resistance. Maximum rpm is 6,000. **Acetal couplings** are lightweight and corrosion resistant. Maximum rpm is 5,000. Color is off-white. Temperature range is –4° to 140°F.

Set Screw Couplings— Fasten to your shafts with four set screws, which bite into the shafts for a tight hold.

Clamp-On Couplings— Fasten onto your shafts for superior holding power without damaging them. Tighten the two socket-head cap screws to secure.

High-Precision Bellows Flexible Shaft Couplings

Bellows couplings have specially designed ridges to compensate for shaft misalignment in low-torque, high-precision applications such as instrumentation and motion control. They also allow zero backlash (no play) and never need lubrication. Couplings are nickel and Type 303 stainless steel so they can be used in mildly corrosive environments. They fasten to your shafts with four set screws, which bite into the shafts for a secure hold. Not rated for maximum rpm.

High-Speed Bellows Flexible Shaft Couplings

With a bellows between two hubs, you'll get flexibility to handle all three types of shaft misalignment with low vibration at high speeds. Couplings allow zero backlash (no play) and are good for precision stepper and encoder motion-control applications. All have lightweight aluminum hubs and a Type 321 stainless steel bellows for corrosion resistance. They fasten onto your shafts for superior holding power without damaging them. Tighten the two socket-head cap screws to secure.

Ultra-Flexible High-Misalignment Shaft Couplings

Specially designed couplings have a flexible, double-loop polyurethane center that's assembled to the hubs to take on high parallel and angular shaft misalignment. They allow zero backlash (no play) and will run smoothly and quietly. Couplings fasten to your shafts with two set screws, which bite into the shafts for a tight hold. Temperature range is 0° to 180° F.

Type 316L stainless steel offers excellent corrosion resistance.

Over-Torque-Prevention Vibration-Damping Flexible Shaft Couplings

To protect power-transmission components from damage, these couplings will shear or tear in over-torque conditions (such as when a machine jams) to sever connections between shafts. All have steel hubs and a flexible neoprene center that not only compensates for misalignment, but also dampens vibration and shock loads. Couplings have no metal-on-metal contact, reducing noise and eliminating the need for lubrication. They fasten to your shafts with two set screws, which bite into the shafts for a tight hold. Temperature range is –30° to 212° F.

Replaceable-Center Vibration-Damping Flexible Shaft Couplings

A flexible tire on these couplings safeguards components on your shafts by damping vibration and shock. Couplings also handle moderate parallel, angular, and axial shaft misalignment as well as fair amounts of torque. To create a complete coupling, order two coupling hubs, one tire, and two quick-disconnect (QD) bushings from the same line in the listing below.

Coupling hubs are steel and high-strength ductile iron.

Tires are Buna-N rubber. Temperature range is –65° to 180° F.

QD bushings are easy to install and remove. They are made of steel or high-strength ductile iron. Tighten their cap screws to secure them to your shafts. For information on QD bushing styles, see page 1092.

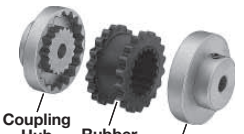
Heavy Duty Replaceable-Center Flexible Shaft Couplings

Components of a Coupling Shown Assembled



A rubber center allows four-way flexing so couplings can take on parallel, angular, axial, and torsional misalignment plus dampen vibration and shock. With no metal-to-metal contact, there's no need for lubrication. Couplings have a keyway with ANSI or ISO-DIN keyway dimensions (except 1/4" and 3/8" shaft dia. sizes do not have a keyway) to provide a more secure hold on keyed shafts. They fasten to your shafts with four set screws, which bite into the shafts for a tight hold. To create a complete coupling, order two hubs and one rubber center from the same line in the listing below.

Coupling hubs are made of cast iron (except hubs with 2 1/16" and 2 15/32" ODs as well as inch-size hubs with 3 1/4" and 4" ODs are made of sintered steel).

Rubber centers have a temperature range of –30° to 275° F.

To Order: For inch-size coupling hubs, please specify shaft dia. size in 1/8" increments from those available below.

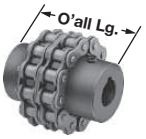
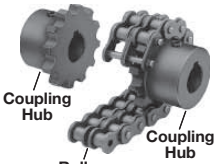
Heavy Duty High-Torque Flexible Shaft Couplings



Components of a Coupling Shown Assembled



Rugged, roller-chain design allows excellent torque and angular misalignment capacities. All couplings have a keyway with standard ANSI keyway dimensions for a more secure hold on keyed shafts. Lubrication is required. To create a complete coupling, order two hubs and one roller chain from the same line in the listing below. Complete couplings meet ANSI B29.23M-1995.

Coupling hubs are machined steel with hardened teeth (6407K41 has 12 teeth; 6407K42 and 6407K43 have 16 teeth; 6407K44 has 18 teeth). They fasten to your shafts with one set screw, which bites into the shafts for a tight hold.

Roller chains are steel and are double stranded. 6407K51 and 6407K52 are ANSI No. 40-2; 6407K53 is ANSI No. 50-2; 6407K54 is ANSI No. 60-2.

Optional covers retain grease lubrication and provide protection from abrasion and corrosion. They're made of nylon. Color is orange.

To Order: For coupling hubs, please specify shaft dia. size in 1/8" increments from those available below.

O'all Lg.	OD With Cover	OD Without Cover	Max. rpm	Max. Torque, in.-lbs.	Maximum Misalignment Parallel	Angular	Coupling Hubs (2 Required for Complete Coupling) Available Sizes For Shaft Dia.			Roller Chains		Optional Covers

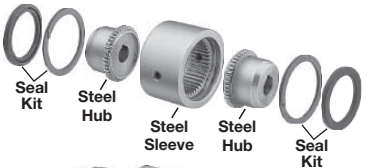
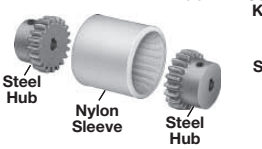
Heavy Duty High-Torque Replaceable-Center Flexible Shaft Couplings

Components of a Coupling Shown Assembled





Compensate for parallel, angular, and axial misalignment in high-torque applications. Couplings have a keyway with standard ANSI keyway dimensions for a more secure hold on keyed shafts.

Steel hub and steel sleeve couplings have a rigid gear design, which transmits more torque than other couplings of the same size. Lubrication is required. To install, heat the hubs to expand them slightly and fit them onto the shaft. When they cool, hubs shrink to fit the shaft tightly. To create a complete coupling, order two hubs, one sleeve, and one seal kit from the same line in the listing below. Each *seal kit* includes two Buna-N lubrication seals and two steel snap rings.

Steel hub and nylon sleeve couplings are compact and lightweight. Lubrication is not required. Maximum temperature is 180° F. Hubs fasten to your shafts with two set screws, which bite into the shafts for a tight hold. To create a complete coupling, order two hubs and one sleeve from the same line in the listing below.

To Order: For coupling hubs, please specify shaft dia. size in 1/8" increments from those available below.

Over-Torque-Prevention Flexible Shaft Couplings

If they exceed maximum torque, these couplings disengage, sound an alarm, and then automatically re-engage once the over-torque condition is eliminated. Torque can be adjusted ±10% of the factory setting. Maximum rpm is 1,800. No lubrication is required.

Couplings have a steel body and aluminum hubs. They also have a keyway with standard ANSI keyway dimensions (except 6609K11 does not have a keyway) that, when used with a key on a keyed shaft, provides a more secure hold. All fasten to your shafts with two set screws, which bite into the shafts for a tight hold.

To Order: Please specify maximum torque: 25, 50, 75, 100, or 125 in.-lbs.

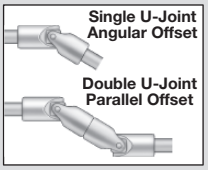
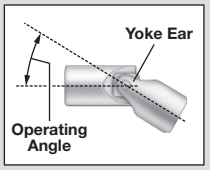
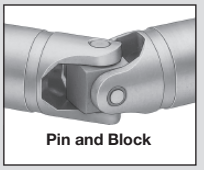
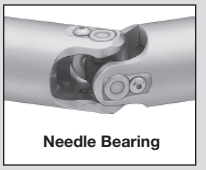
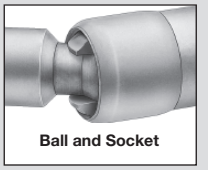
About U-Joints (Universal Joints)











U-joints are used to connect two shafts that have a high amount of misalignment. When choosing a U-joint, consider the amount of misalignment as well as the speed (rpm) and torque the joint will need to transmit. The more the shafts are misaligned, the less speed and torque the U-joint will be able to transmit.

Single U-joints compensate for angular offset, while **double U-joints** compensate for parallel offset. When using two single U-joints or one double U-joint, the U-joints must be installed at the same operating angle and the yoke ears must be aligned. As the operating angle increases, the working torque decreases.

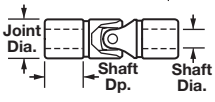
Optional protective boots, also known as bellows, keep lubricant in and contaminants out. They are sold separately on page 3872.

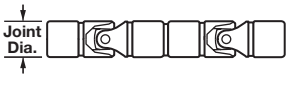
Pin-and-Block U-Joints—Have the simplest design: a block and two pins. They work at slower speeds but transmit greater torque than needle-bearing U-joints of similar size.

Needle-Bearing U-Joints—Needle bearings reduce side-to-side play (backlash), increasing rpm capability. They can operate at much higher speeds than pin-and-block and ball-and-socket U-joints.

Ball-and-Socket U-Joints—Operate smoothly, with no side-to-side play (backlash) so they are good for applications requiring consistent motion and precise control. They generally transmit lower torque than pin-and-block U-joints and work at slower speeds than needle-bearing U-joints.

Pin-and-Block U-Joints





Simple yet strong, these U-joints connect shafts at angles up to 25°. Maximum rpm is 1,750. All have grooves for holding protective boots (not included; please see page 3872). U-joints *with keyway and set screw* connect to shafts with an included set screw and a keyway with standard ANSI keyway dimensions. To connect all others, drill a hole through the joint and shaft and insert a spring pin (not included; please see pages 3359-3365).

Type 303 stainless steel offers excellent corrosion resistance.

Unbored Ends—Have a small centered starter hole for boring.

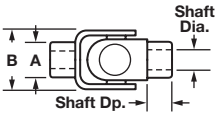
High-Torque Needle-Bearing U-Joints



Oversized U-joints handle more torque than any other needle-bearing U-joint we offer. They connect shafts at angles up to 45° and their lube fittings make lubrication easy. U-joints connect to shafts with included set screws and a keyway with standard ANSI keyway dimensions (except heavy duty U-joint with 7/8" shaft dia., which has a 1/4" x 1/8" keyway). Maximum rpm is 1,000.

Standard joints are cast ductile iron. Overall length is 5".

Heavy duty joints are forged steel. Overall length is 5 1/2".

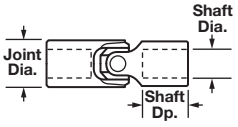
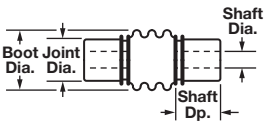
High-Speed Compact Needle-Bearing U-Joints





Compact, yet capable of transmitting extremely high speeds. All U-joints connect shafts at angles up to 35°. Maximum rpm is 6,000.

Standard—To connect these U-joints to a shaft, drill a hole through the joint and shaft and insert a spring pin (not included; please see pages 3359-3365).

Booted with Keyway—U-joints have a protective boot (nitrile for alloy steel U-joints; silicone for stainless steel U-joints) to keep lubricant in and contaminants out. All U-joints connect to shafts with an included set screw and a keyway with standard ANSI keyway dimensions.

Type 303 stainless steel offers excellent corrosion resistance. All have Type 303 stainless steel hubs and steel needle bearings.

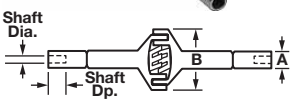
Extreme-Angle Geared U-Joints



A set of gears transmit rotary motion at angles up to 136°—the widest angle of all our U-joints. All have a gear ratio of 1:1 and are good for hand-powered, low-speed applications. U-joints and gears are steel. To connect to a shaft, drill a hole through the joint and shaft and insert a spring pin (not included; please see pages 3359-3365). Not rated for torque.

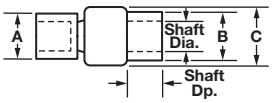
Ball-and-Socket U-Joints



Steel

Plastic

Select ball-and-socket U-joints for smooth, consistent motion with zero backlash (no play).

Steel joints connect shafts at angles up to 30°. Use the included spring pins to connect. Maximum rpm is 1,800.

Plastic joints connect shafts at angles up to 45°. To connect, drill a hole through the joint and shaft and insert a spring pin (not included; please see pages 3359-3365). Maximum temperature is 410° F. Not rated for rpm.

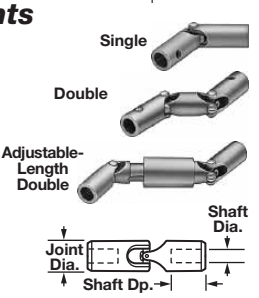
Corrosion-Resistant Miniature Ball-and-Socket U-Joints



Able to stand up to corrosion, these tiny joints are Type 303 and Type 440 stainless steel with sealed-in lubrication. They connect small shafts at angles up to 30°. Not rated for rpm.

To connect 60075K77 and 60075K87 joints to a shaft, use a 6-32 set screw (not included) at each end. To connect all others, drill a hole through the joint and shaft and insert a spring pin (not included; please see pages 3359-3365).

Adjustable-length double joint adjusts from 2 3/4" to 3" long. The center section is 9/16" diameter.

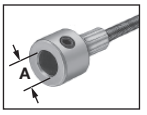
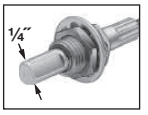
Flexible Drive Shafts

Standard Steel Shaft with Female Fittings on Both Ends

Fittings for Standard Drive Shafts

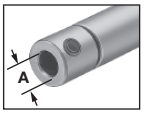


Female

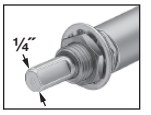


Panel Mount

Fittings for Heavy Duty Drive Shafts



Female



Panel Mount

Snake these flexible drive shafts around curves and obstructions to transmit rotary motion along any path. Shafts operate in clockwise and counterclockwise directions (except standard Type 316 stainless steel shafts operate in clockwise direction only). Maximum torque is reduced by approximately 30% when operating counterclockwise. Rotate drive shafts manually with a knob (not included) or mechanically.

Female fittings include set screws for securing.

Panel-mount fittings attach to a panel by pushing the drive end of the shaft through a 3/8" hole in the panel and securing with the included locknuts. The drive end measures 1/4" in diameter and has a flat side for fastening to a manual control knob.

Standard Drive Shafts—*Steel shafts* have zinc-plated steel fittings. *Type 316 stainless steel shafts* have Type 316 stainless steel fittings and offer superior corrosion resistance.

Heavy Duty Drive Shafts—With a strong carbon steel core, a protective plastic case, and bearings, these rugged shafts handle the demands of high-torque applications. Fittings are carbon steel (except shafts with panel-mount fitting and female fitting, which are zinc-plated carbon steel). Maximum temperature is 190° F.

Shafts with steel ball bearings allow higher speeds than shafts with bronze bearings.

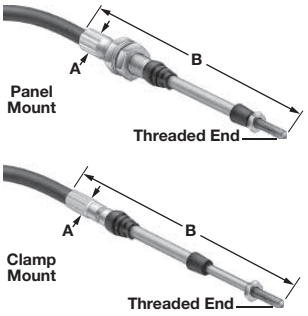
Push/Pull Control Cables



Weave these flexible cables around obstructions to initiate push/pull motion to operate valves, throttle controls, and HVAC damper controls from a remote location. Operate with a lever or knob (not included).

Standard cables have a plastic conduit cover, stainless steel core, and zinc-plated steel fittings. Temperature range is –40° to 210° F.

Corrosion-resistant cables have a plastic conduit cover, steel core, and 300 series stainless steel fittings. Temperature range is –65° to 230° F.

Low-friction cables have a splined steel core that limits the number of contact points against the liner to provide extra-smooth movement. It also prevents the cable from twisting during operation. Cables have a plastic conduit cover with a lubricant-impregnated lining. Fittings are zinc-plated steel. Temperature range is –40° to 210° F.

Panel-Mount Cables— Also known as bulkhead mount cables, these have threaded fittings with hex nuts and washers at each end for mounting through a panel.

Clamp-Mount Cables— Have threaded fittings on both ends and a grooved body for mounting with U-bolts or strap clamps (sold separately below).

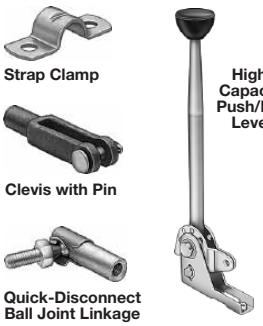
Accessories



Clevis with pin makes durable pivot-point linkages for shafts.

Quick-disconnect ball joint linkage allows an excellent pivoting connection between a shaft and a control.

High-capacity push/pull lever handles up to 200 lbs. of dynamic push/pull loads and is for use with cables that have a 3" maximum stroke (load rating with cable and hardware will be limited to the lowest rated component in your system). Lever is zinc-plated steel with a plastic knob and is 5 3/8" Lg. × 15 1/2" Ht.

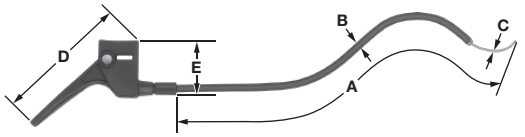
Lever and Knob Push/Pull Control Cables



Trigger Lever Controlled Cable

Knob Controlled—Nonlocking

Knob Controlled—Turn to Lock

Precision Knob Controlled

Conveniently supplied with a lever or knob, these cable assemblies are ready to initiate push/pull motion from a remote location. The cables are flexible and can be angled around obstructions.

Trigger lever controlled cable assembly has a nylon spring-return trigger attached to a control cable. The cable has a galvanized steel core with a vinyl conduit cover and can be cut to length. Mount to a 3/4" to 1" dia. tube or handlebar with a screw (not included; 0.2" hole dia.). Maximum temperature is 120° F.

Knob controlled cable assemblies have a plastic knob attached to a control cable. The cable has a Type 302 stainless steel core with a polyethylene conduit cover and can be cut to length. All can be panel mounted. Temperature range is –40° to 225° F.

Turn to lock can be locked in position, which is good for applications where severe vibration is a concern. Pull and turn the handle to its locking position.

Precision is for fine-tuning throttle positions.

About Rod Ends

Rod ends are connectors that support loads and allow motion control. You'll find them in a multitude of applications: steering, tensioning, and controlling movement at pivot points.

Ball Joint Rod Ends (pages 1247-1255)— Have a housing and a ball that swivels to handle angular misalignment. They're also known as rod-end bearings. *Ball-joint linkages* are ball-joint rod ends with studs attached to simplify mounting.

Solid Rod Ends (pages 1256-1258)— Have no moving parts and are designed to handle heavier static loads. Also known as swing bolts and eyebolts, their one-piece body doesn't allow angular misalignment.

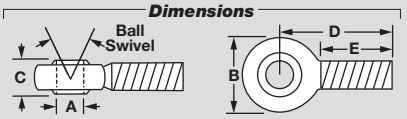
Left- and right-hand rod ends (ball joint or solid style) create connections that adjust for tension.

Ball-joint linkages handle misalignment as well as changes in direction.

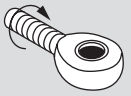
CAD For technical drawings and 3-D models, go to mcmaster.com.

Ball Joint Rod Ends

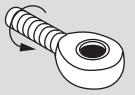
Dimensions



Thread Direction



Right-hand threaded shank tightens when turned clockwise. This is the most common thread.



Left-hand threaded shank tightens when turned counter-clockwise.

Steel Ball Joint Rod Ends CAD

Our general purpose rod ends will meet your basic connection needs.

Inch sizes have a zinc-plated steel housing and chrome-plated steel ball (unless noted).

Inch sizes with grease fitting are easy to lubricate. Housing is steel. Ball is chrome-plated steel.

Inch sizes with oversized shank have a shank that is one size larger than the ball ID to handle greater stress. Housing is zinc-plated steel. Ball is chrome-plated steel.

Inch sizes with self-lubricating insert have a zinc-plated steel ball that glides on a PTFE-lubricated, carbon-fiber-reinforced plastic insert, which provides wear resistance and doesn't require lubrication. Housing is zinc-plated steel.

Metric sizes have an alloy steel ball. Housing is zinc-plated steel (unless noted).

To Order: Please specify right- or left-hand shank threads.

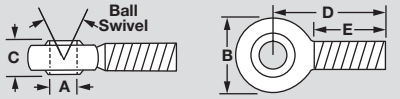
◆Right-hand shank threads only. ▲Machined steel housing and ball. ★Phosphate-plated bearing steel ball.

Ball Joint Rod Ends

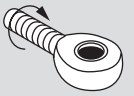
For technical drawings and 3-D models, go to mcmaster.com.

For information about rod ends, see page 1247.

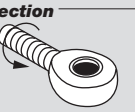
Dimensions



Thread Direction



Right-hand threaded shank tightens when turned clockwise. This is the most common thread.



Left-hand threaded shank tightens when turned counter-clockwise.

High-Strength Steel Ball Joint Rod Ends

Male Threaded

Female Threaded

Choose these rod ends for connections that need to handle heavy loads. ***Rod ends with an oversized shank*** have a shank that is one size larger than the ball ID to handle greater stress.

With PTFE-Lined Steel Insert— A PTFE-lined steel insert allows smooth ball rotation and reduces the need for lubrication. Ball is chrome-plated bearing steel and housing is zinc-plated, chromate-treated alloy steel (except rod ends with a 1″-12 thread size have a plain steel housing).

With PTFE/Kevlar Insert— A heat-treated, chrome-plated bearing steel ball glides on a durable, self-lubricating, self-sealing PTFE/Kevlar insert. Housing is heat-treated chrome molybdenum steel.

To Order: Please specify right- or left-hand shank threads.

▲O'all Wd. (B) is 2 3/4″.

Stainless Steel Ball Joint Rod Ends

Male Threaded

Female Threaded

A Type 303 stainless steel housing and Type 440C stainless steel ball provide excellent corrosion resistance while a PTFE liner allows smooth ball rotation and reduces the need for lubrication.

To Order: Please specify right- or left-hand shank threads.

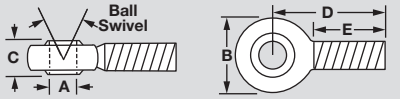
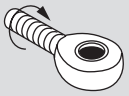
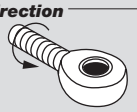
Dimensions



Thread Direction



Right-hand threaded shank tightens when turned clockwise. This is the most common thread.



Left-hand threaded shank tightens when turned counter-clockwise.

Metric Stainless Steel Ball Joint Rod Ends

Need excellent corrosion resistance while working with metric components? These rod ends have a Type 303 stainless steel housing and Type 440C stainless steel ball. They also have a PTFE liner that allows smooth ball rotation and reduces the need for lubrication.

To Order: Please specify right- or left-hand shank threads.

Bronze Insert Ball Joint Rod Ends

An oil-impregnated bronze insert reduces the need for lubrication and provides corrosion resistance. All rod ends have a zinc-plated steel housing and a chrome-plated steel ball.

Metric sizes include a grease fitting.

To Order: Please specify right- or left-hand shank threads.

Ultra-Precision Ball Joint Rod Ends

Made to extremely tight tolerances, these rod ends are for applications that require positioning accuracy, such as accelerator and other types of control linkages. They have a chrome-plated bearing steel ball, which is heat treated for added strength, that glides on a brass insert for smooth operation. Housing is steel for thread size 6-32; cadmium-plated steel for thread size 8-32; zinc-plated steel for all others. All have right-hand shank threads.

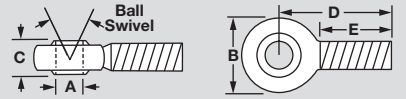
Ball Joint Rod Ends

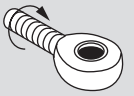
For technical drawings and 3-D models, go to mcmaster.com.

For information about rod ends, see page 1247.

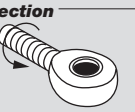
Dimensions



Thread Direction



Right-hand threaded shank tightens when turned clockwise. This is the most common thread.



Left-hand threaded shank tightens when turned counter-clockwise.

Corrosion-Resistant Nylon Ball Joint Rod Ends

Made of an impact-resistant nylon composite, these rod ends withstand corrosion as well as fuels, lyes, and weak acids. They are also 80% lighter than steel. A self-lubricating nylon ball ensures low friction and maximum abrasion resistance. Temperature range is –22° to +176° F.

To Order: Please specify right- or left-hand shank threads.

Super-Swivel Ball Joint Rod Ends

With at least 55° of ball swivel, these rod ends accommodate greater misalignment than any other rod end we offer. All have a black-oxide coated, alloy steel housing and a chrome-plated bearing steel ball that are heat treated for added strength. A PTFE liner allows smooth ball rotation and reduces the need for lubrication.

To Order: Please specify right- or left-hand shank threads.

Rod-End Inserts

Attach these adapters to your rod end to move your fastener away from the rod-end body to increase misalignment capabilities.

High-Misalignment Step-Down Inserts— The ID of your rod end is decreased to allow approximately 60° of misalignment. Made of 17-4 PH stainless steel.

Washer Inserts— Also known as retaining safety washers, these inserts protect your rod end and handle some additional misalignment without changing your ball ID. Made of zinc-plated steel.

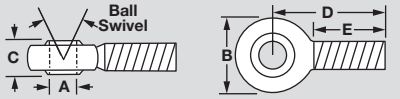
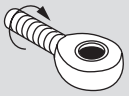
♣ Available with right-hand thread only.

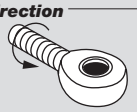
Dimensions



Thread Direction



Right-hand threaded shank tightens when turned clockwise. This is the most common thread.



Left-hand threaded shank tightens when turned counter-clockwise.

High-Speed Mil. Spec. Ball Bearing Rod Ends

A double row of precision ball bearings allows high speeds and smooth operation. All rod ends have a heat-treated, cadmium-plated steel housing; heat-treated bearing steel balls that are packed with grease that meets MIL-PRF-81322G; and a heat-treated, cadmium-plated bearing steel insert. They also have PTFE seals to block contaminants.

Male-threaded rod ends meet MS-21151. ***Female-threaded rod ends*** meet MS-21153. All have right-hand shank threads.

Thrust-Rated Ball Joint Rod Ends

Thanks to an innovative body design that keeps the ball from being pushed out, these rod ends are able to take on thrust (side) loads. All have a zinc-plated steel housing; a steel ball; and an injection-molded, self-lubricating polyurethane insert. Temperature range is –40° to +176°F.

To Order: Please specify right- or left-hand shank threads (unless noted).

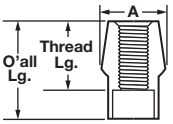
Tube-End Weld Nuts



Connect threaded parts and add threads to the ends of uncoated steel tubes. Also known as tube adapters and weldable threaded tube ends, they can be welded on uncoated metal surfaces. Nuts are 4130 alloy steel. They have a Class 2B thread fit.

To Order: Please specify right- or left-hand threads.

Seals for Ball Joint Rod Ends

Keep dirt out and lubrication in to extend the life of your rod ends. Seals are nitrile with a stainless steel washer for corrosion resistance. Use them between the head of your rod end and your fastener.

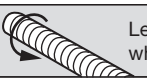
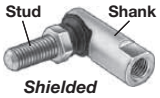
Right-hand threaded shank tightens when turned clockwise. This is the most common thread.



Left-hand threaded shank tightens when turned counterclockwise.

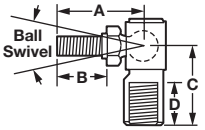
Ball Joint Linkages



Shielded

Bent Swivel

Quick Disconnect



These linkages permit movement and misalignment while allowing adjustment for excess play. Inside each linkage housing you'll find a free-moving ball stud that provides an excellent pivoting connection between light mechanical components and controls. Linkages have a female-threaded shank with right-hand threads (unless noted). They are not load rated.

Steel Linkages— Housing and ball stud are zinc-plated steel.

Stainless Steel Linkages— Housing and ball stud are 300 Series stainless steel for corrosion resistance.

Shielded linkages have a rubber shield that keeps dirt and other contaminants out. ***Bent-swivel linkage*** is lightweight and good for light duty applications. ***Quick-disconnect linkages*** have a retaining sleeve that's easy to disconnect from the ball stud for quick installation.

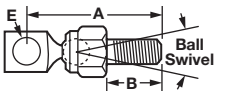
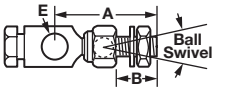
■ **To Order:** Please specify right- or left-hand shank threads.

Inline Ball Joint Linkages

Without Set Screw



With Set Screw and Nut



Also known as control swivels, these linkages have a "captured" ball with a free-moving ball stud, which provides an excellent pivoting connection between light mechanical components and controls while constraining excess play. Their inline design makes them the choice for linear push applications along the length of a connecting rod.

In addition to a zinc-plated steel housing and ball stud, these linkages have a vibration-damping rubber disc. Maximum ball swivel is 30°. Temperature range is –60° to +250° F. All have right-hand threads. They are not load rated.

Linkages with set screw and nut have a self-locking set screw and integral nut with lock washer for added holding strength.

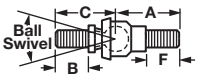
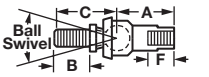
Heavy Duty Inline Ball Joint Linkages

Male-Threaded Shank



Female-Threaded Shank



Made to withstand wear, our heavy duty linkages have a polyurethane liner (also known as a boot) that not only keeps out contaminants, but also acts as a cushion to reduce vibration. Use these linkages to compensate for misalignment and to make pivoting connections. The housing and ball stud are made of zinc-plated steel. Maximum ball swivel is 35°. Temperature range is –40° to +176° F. All have right-hand threads. They are not load rated.

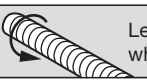
Right-hand threaded shank tightens when turned clockwise. This is the most common thread.



Left-hand threaded shank tightens when turned counterclockwise.

Heavy Duty Ball Joint Linkages

Able to stand up to frequent use, these linkages offer superior wear resistance. All are ball joint rod ends with the studs attached to simplify mounting. They have a chrome-plated, bearing-steel ball stud that's machined to fit perfectly inside its housing, which is zinc-plated steel. Linkages are great for clutches, throttles, and shift control rods. Periodic lubrication may be required to keep them operating smoothly. Maximum ball swivel is approximately 50°. They are not load rated.

Linkages with grease fitting are easy to lubricate.

To Order: Please specify right- or left-hand shank threads as well as right- or left-hand stud threads.

Lubrication-Free Heavy Duty Ball Joint Linkages

In addition to superior wear resistance, these linkages have an insert that's designed to eliminate the need for lubrication. All are ball joint rod ends with the studs attached to simplify mounting. They have a ball stud that's machined to fit perfectly inside its housing. Linkages are great for clutches, throttles, and shift control rods. Maximum ball swivel is approximately 50°. They are not load rated.

Lubrication-free linkages have an oil-impregnated bronze insert. Housing is zinc-plated steel. Ball stud is chrome-plated steel.

High-performance lubrication-free linkages have a PTFE-lined, heat-treated steel insert; a zinc-plated alloy steel housing; and a chrome-plated, bearing-steel ball stud. Temperature range is –65° to +325° F.

To Order: Please specify right- or left-hand shank threads as well as right- or left-hand stud threads.

Metric Heavy Duty Ball Joint Linkages

Offering strength and durability, these linkages are ball joint rod ends with studs attached to simplify mounting on your metric components. All have a die cast zinc housing and a right-hand threaded steel ball stud. A synthetic rubber dust cover seals the ball joint (which comes packed with lubricant) to keep dirt out. Maximum ball swivel is 34°. Maximum temperature is 176° F. All linkages have a female-threaded shank.

To Order: Please specify right- or left-hand shank threads.

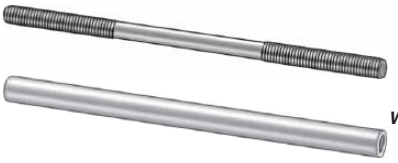
Right-Hand Threaded Connecting Rods



Add rod ends to one of these connecting rods to build a linkage. All have right-hand threads on both ends and are designed to work with right-hand threaded rod ends. Use them for remote valve operators, throttle controllers, shifting mechanisms, and virtually any push/pull assembly. Thread sizes through 5/16" are zinc-plated steel; 3/8" and larger are high-strength aluminum.

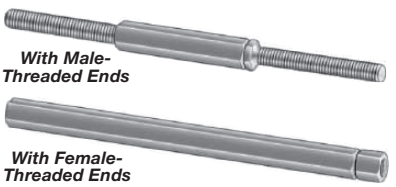
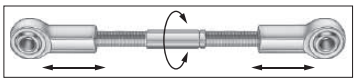
Easy-Adjust Turnbuckle-Style Threaded Connecting Rods





Similar to turnbuckles, these rods have right-hand threads on one end and left-hand threads on the other so you can make a linkage that adjusts for tension. Add right- and left-handed rod ends to build your linkage. All rods are made of high-strength aluminum. They have a hex-shaped body so you can adjust them with a wrench.

Note: The end with the left-handed threads is marked with a groove.

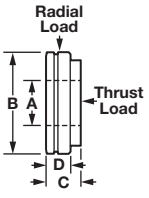
Thrust-Rated Ball Joint Bearings



With a unique housing (outer ring) and ball (inner ring) design, these bearings are able to support heavy one-direction thrust loads and combination radial/thrust loads. Use them in tight spots where a rod end shank won't fit, or mount them in a drilled hole or a rod end blank (see page 1258). Also known as spherical bearings, each has a bearing steel housing and ball. They require lubrication and are not rated for maximum ball swivel.

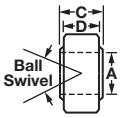
Ball Joint Swivel Bearings

Fiber-Reinforced Plastic

Standard Steel and Stainless Steel

Lubrication-Free Steel and Stainless Steel



Also known as spherical bearings, all of these bearings contain a ball that pivots to accommodate misalignment. Use them in tight spots where a rod end shank won't fit. ***Standard bearings*** require lubrication. ***Lubrication-free bearings*** have a PTFE-lined insert (except bearings with fiber-reinforced plastic housing) and do not require lubrication.

Fiber-Reinforced Plastic Housing— The housing and ball are fiber-reinforced plastic, which is 80% lighter than steel and offers superior corrosion resistance. Temperature range is –22° to +176° F.

Steel Housing with Steel Insert— Have a steel housing and insert with a chrome-plated, bearing steel ball that is heat treated for strength. Temperature range is –65° to +425° F for standard bearings; –65° to +275° F for lubrication-free bearings.

Stainless Steel Housing with Stainless Steel Insert— Offering excellent corrosion resistance, these bearings have a Type 303 stainless steel housing and insert with a Type 440C stainless steel ball that is heat treated for strength. Temperature range is –65° to +425° F for standard bearings; –65° to +275° F for lubrication-free bearings.

Metric Steel Housing with Steel Insert— Have a steel housing and insert with a chrome-plated steel ball. Temperature range is –30° to +300° F.

Extended-Life Ball Joint Swivel Bearings

Specially designed lubrication channels and integral polyester seals allow these bearings to last up to three times longer than other ball joint swivel bearings. Also known as spherical bearings, each has a bearing steel housing, insert, and ball that pivots to accommodate misalignment. Seals keep grease in and contaminants out. Bearings come greased, and can be lubricated through a hole in the housing without removing the load. Maximum temperature is 250° F.

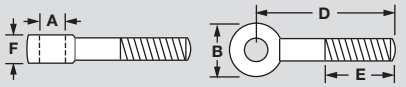
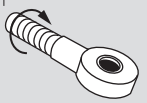
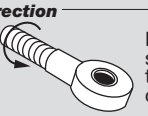
Dimensions



Thread Direction



Right-hand threaded shank tightens when turned clockwise. This is the most common thread.



Left-hand threaded shank tightens when turned counter-clockwise.

Partially Threaded Solid Rod Ends

Also known as swing bolts and eyebolts, solid rod ends make connections in applications that don't need to compensate for misalignment.

Male Right-Hand Threaded Shank

Steel—Have a black-oxide finish (except 10-32 shank thread size is plain steel). Tensile strength is 75,000 psi. *Metric sizes* meet DIN 444.

Types 303 and 304 Stainless Steel—Offer good corrosion resistance. Tensile strength is 85,000 psi. *Metric sizes* meet DIN 444.

Type 316 Stainless Steel—Offer excellent corrosion resistance. Tensile strength is 80,000 psi.

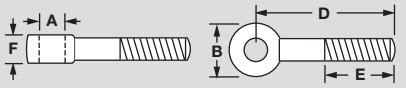
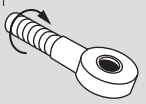
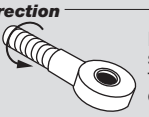
Dimensions



Thread Direction



Right-hand threaded shank tightens when turned clockwise. This is the most common thread.



Left-hand threaded shank tightens when turned counter-clockwise.

Fully Threaded Solid Rod Ends

For maximum mounting flexibility, cut the fully threaded shaft to whatever length you need. Also called eyebolts, all of these rod ends have right-hand shank threads.

Steel— Have a black-oxide finish and meet ASTM A521, Class CA (except 10-32 shank thread size). Minimum tensile strength is 60,000 psi.

Alloy Steel— Have a black-oxide finish and meet ASTM A193-B7 (except 10-32 shank thread size). Minimum tensile strength is 125,000 psi.

Stainless Steel— Made of Type 304 stainless steel, these rod ends offer excellent corrosion resistance and meet ASTM A193-B8 (except 10-32 shank thread size). Minimum tensile strength is 75,000 psi.

★ Type 303 stainless steel. ■ Thread length is 3".

Square-Shoulder Solid Rod Ends

Also known as jig latch bolts, these rod ends mount flush to any flat surface. They're commonly used to mount a workpiece flush to a machining table. All have right-hand shank threads.

Steel— These steel rod ends are heat treated for added strength and have a black-oxide finish. Tensile strength is 78,000 psi.

Stainless Steel— Made of Type 303 stainless steel, these rod ends offer excellent corrosion resistance. Tensile strength is 100,000 psi.

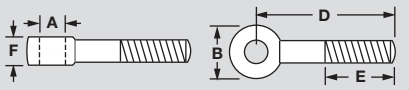
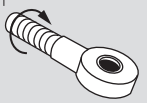
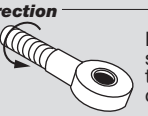
Dimensions



Thread Direction



Right-hand threaded shank tightens when turned clockwise. This is the most common thread.



Left-hand threaded shank tightens when turned counter-clockwise.

Left-Hand Threaded Solid Rod Ends

Create linkages and shaft connections in applications that require left-hand threads. Also called swing bolts and eyebolts, these rod ends are made of steel with a black-oxide finish. Tensile strength is 75,000 psi.

Solid Rod End Blanks

Cut, tap, bore, or weld these rod ends to your exact requirements. They have an unfinished shank and come with a large, centered starter dimple for drilling, unless noted.

Steel— Made of C1035 steel. Tensile strength is 75,000 psi.

Alloy Steel— Made of 4140 alloy steel. Tensile strength is 125,000 psi.

Type 304 Stainless Steel— Offer good corrosion resistance. Tensile strength is 85,000 psi.

Type 316 Stainless Steel— Offer excellent corrosion resistance. Tensile strength is 75,000 psi.

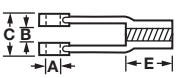
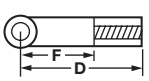
■ Does not have a starter dimple.

Forged Clevis Rod Ends





Make durable pivot-point linkages for shafts, rods, and other assemblies. Also called yoke end linkages, these rod ends are forged for added strength and have female right-hand shank threads. Each comes with a clevis pin and a cotter pin.

Steel— Machined to Society of Automotive Engineers (SAE) standards.

Zinc-Plated Steel— Have a corrosion-resistant finish.

Type 316 Stainless Steel— Offer excellent corrosion resistance.

Forged Steel Clevis Rod End Blanks

Thread or weld the unfinished shank of these rod ends to meet your specific linkage needs. Sometimes called yoke end linkages, they're good for making pivot-point linkages for shafts, rods, and other assemblies. All are made of C1018 steel and are forged for added strength. Each comes with a clevis pin and a cotter pin.

Corrosion-Resistant Plastic Clevis Rod Ends

In addition to offering superior corrosion resistance, these lightweight, fiber-reinforced plastic rod ends also reduce noise and vibration. Often called yoke end linkages, they're good for making pivot points for shafts, rods, and other assemblies. All have female right-hand threads. Each comes with a clevis pin and a retaining clip.

Easy-Adapt Clevis Rod Ends

Each rod end has a convenient snap-on spring clevis pin that you can insert and remove by hand. Also known as yoke end linkages, they're good for use as pivot points for shafts, rods, and other assemblies. All are zinc-plated steel and have female right-hand threads.

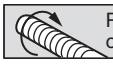
Male Shank Clevis Rod Ends

A male-threaded shank lets you build a linkage with a tapped tube or other female-threaded connection. Great for a wide variety of pivot-point applications, all are made of zinc-plated steel. Clevis pins are not included, see pages 3388-3393.

To Order: Please specify right- or left-hand shank threads.



Right-hand threaded shank tightens when turned clockwise. This is the most common thread.

Left-hand threaded shank tightens when turned counterclockwise.

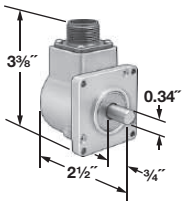
Washdown Rotary Motion Position-Measuring Transmitters

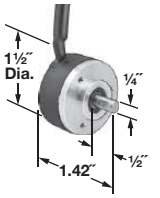


Count on these transmitters to withstand tough environments—they are IP66 rated and meet NEMA 4 and 13 for protection from dust, dirt, washdowns, and oil/coolant spraying. Also known as incremental optical encoders, transmitters convert rotary motion to an electrical signal so you can control system automation. Connect them to motor shafts, conveyors, and wheels to measure distance, direction, and speed of travel. They can be used for shaft speeds up to 8,000 rpm. Use a flexible shaft coupling (not included) to connect the transmitter shaft to a drive shaft.

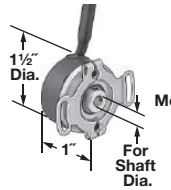
Transmitters have two quadrature output channels (A and B) as well as an index channel (Z). They can provide a 2X or 4X resolution increase; transmitters must be used with a controller that has quadrature detection to get a 4X increase. Frequency response is 100 kHz. They have an M14 6-pin connector and a line driver output. Input voltage is 5-28 volts DC. All have an aluminum body with a stainless steel shaft. Temperature range is 32° to 158° F.

Current, mA		*Mounting Plate*			*Mounting Hole*				
Max. Input	Output	Lg.	Wd.	Thick.	Dia.	Ctr.-to-Ctr.	Choose a Resolution		
250	100	2.06″	2.06″	0.3″	0.156″	1¾″	10, 200, 360, 500, 600	**59515K51**	$507.58

Miniature Rotary Motion Position-Measuring Transmitters



With Shaft



With Mounting Plate

Also known as incremental optical encoders, these miniature transmitters convert rotary motion to an electrical signal that indicates distance, direction, and speed of travel. They're often used to automate servomotors, robotics, and assembly machines. Transmitters meet IP64 for protection from dust and water spray.

All have two quadrature output channels (A and B) and an index channel (Z). They can provide a 2X or 4X resolution increase; you must use transmitters with a controller that has quadrature detection to get a 4X increase. Frequency response is 200 kHz. Transmitters have wire leads for electrical connection and NPN open collector output that requires a pull-up resistor (not included) for operation. Input voltage is 5-28 volts DC. For 8,000 rpm max. shaft speed. Transmitters have an aluminum body and plastic housing. Temperature range is -4° to 185° F.

Transmitters with ¼″ Shaft—Often used with servomotors, these transmitters have a mounting hole pattern that fits a three-hole 28 mm BC servomotor face. Use a flexible shaft coupling (not included) to connect the transmitter shaft to a drive shaft. Mounting hole size is M3 × 4.57 mm (fasteners not included). Transmitters include sealed ball bearings. Shaft is stainless steel.

Transmitters with Mounting Plate—These transmitters have a flexible mounting plate that compensates for shaft misalignment and vibration. Slide them onto a motor shaft and secure with the two included set screws. Mounting plate has two holes for 6-32 screws (not included).

	For Shaft Dia.	*Current, mA* Max. Input	Output	Mounting Hole Ctr.-to-Ctr.	Choose a Resolution		
With ¼″ Shaft	—	65	20	—	500, 1,000, 2,000, 2,500	**9749T3**	$221.23
With Mounting Plate	¼″	65	20	1.81″	500, 1,000, 2,000, 2,500	**9749T1**	221.23

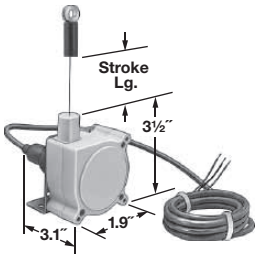
Linear Motion Position-Measuring Transmitters



Measure the position of an object moving in a straight line. Also known as potentiometers and string pots, these transmitters have an extendable nylon-coated stainless steel wire cable that measures the relative distance between two points. They convert measurements to an electrical signal for use in controlling system automation. Transmitters meet IP50 for protection from dust.

Transmitters have 40″ wire leads for electrical connection. Input resistance is 10 kOhms. Resolution is 0.0001 mV. All have three ⅛″ dia. mounting holes. Housing is plastic. Temperature range is 0° to 160° F.

Stroke Lg.	*AC/DC Voltage* Max. Input	Output	Accuracy Range	Repeatability Range

Rotary Speed Limiters

With Double-Flat Shaft

With D-Profile Shaft

With Geared Shaft

With Opening for Square Shaft

Install these rotary speed limiters at the hinges of small lids, doors, and access panels for smooth, quiet motion. They're often used in electronics applications. Maximum speed is 50 rpm. They have two mounting holes (fasteners not included). Temperature range is 32° to 122° F, unless otherwise stated.

Speed limiters with double-flat shaft and **speed limiters with D-profile shaft** are polycarbonate with an acetal shaft. Maximum cycles per minute is 10.

Speed limiters with geared shaft must be used with gears that have the same 20° pressure angle and 7 pitch. The geared shaft has 14 teeth with a 0.276″ pitch diameter. Speed limiters are polycarbonate; gear is acetal. Maximum cycles per minute is 10.

Speed limiters with opening for square shaft press-fit onto your shaft. They are steel with a nylon insert and have a minimum temperature of 14° F. Maximum cycles per minute is 12.

Linear Speed Limiters

Put an end to lids and doors that slam shut or fly open—install these speed limiters for smooth, controlled motion.

Compression speed limiters prevent closing doors from slamming; **extension** speed limiters prevent doors from flying open; **compression and extension** speed limiters prevent doors from slamming and flying open.

Nonadjustable speed limiters have an electrocoated steel body with chrome-plated steel rod. Temperature range is -22° to 176° F.

Adjustable speed limiters have an anodized aluminum body with chrome-plated steel rod. Temperature range is -4° to 175° F. To adjust, pull the rod until it's fully extended, then twist it to change the resistance.

Precise-Control Linear Speed Limiters

Regulate the speed or feed rate of drill presses, milling machines, lathes, and similar devices. These speed limiters have a knob with numbered scale so you can make precise adjustments to the resistance. Insert a rod in the mounting hole in the knob to rotate for adjustments; hole diameter is 0.31″. Free travel of stroke is 0%, so the entire stroke is speed controlled. Limiters have a zinc-plated steel body with a stainless steel rod. Temperature range is 40° to 135° F.

Long-Life Gas Spring Style Mechanical Springs

Mechanical operation means these springs have no seals to fail or gas to leak. The ball stud diameter is 16 mm. The body, rod, ball socket, and ball stud are all steel. Temperature range is -50° to 400° F.

About Gas Springs

Gas springs are typically used to assist in opening lids, covers, windows, conveyors, and seats—similar to a hatchback opening on a car. If you want to close an object, you will need a pulling gas spring (see page 1267).

Note: All gas springs contain nitrogen gas and a seal lubricant that also provides slam-resistant damping at the end of the stroke. To avoid loss of force, you should store and install gas springs rod-end down.

Choosing the Right Force

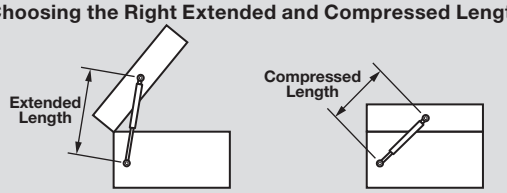
Your gas spring must have enough force to lift your object and hold it open, yet not too much force that you can't push it back to its original position. To determine the right amount of force, you'll need to know the weight of the object you're moving. One way to do this is to use a force gauge (see page 2333).

If you can't weigh your object, use the following chart to help determine its weight so you can estimate the force you'll need:

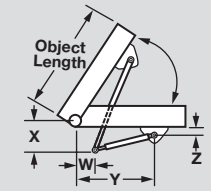
Material Weight per Square Foot (12″×12″)

Thickness	Steel	Aluminum	Plastic
1/16″	2.5 lbs.	0.83 lbs.	0.17 lbs.
1/8″	5.0 lbs.	1.71 lbs.	0.58 lbs.
1/4″	10.0 lbs.	3.61 lbs.	1.10 lbs.

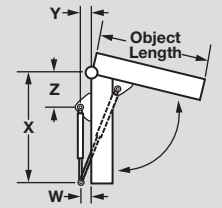
Choosing the Right Extended and Compressed Length



To determine the extended length that's right for your application, open your lid as wide as you need and measure the distance between the two mounting points. For compressed length, close your lid (or lower it to where you need it) and measure the distance between the two mounting points.



Horizontal-to-Vertical Lift



Vertical-to-Horizontal Lift

A Guide to Choosing the Correct Gas Springs

The examples illustrate how the length, weight, and opening direction of your object as well as the mounting position of the springs can affect which gas springs are right for your application. Find an example that is similar to your application and use it as a guide to select your springs. The values are based on using two gas springs (one on each side of the object), a 90° opening, and the center of gravity at the middle of the object.

Note: The recommended force rating is per spring.

For Object Length	For Object Weight	Recommended Gas Spring: Force Rating	Recommended Gas Spring: Extended Length	Recommended Gas Spring: Compressed Length	Recommended Mounting Position: (W)	(X)	(Y)	(Z)

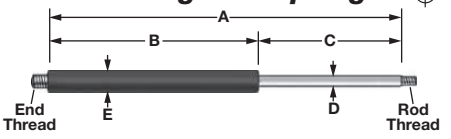
Add-a-Fitting Gas Springs



These gas springs have threaded ends so you can use them with any combination of end fittings, studs, and mounting brackets (sold separately on pages 1263 and 1264). Select end fittings with a thread size that matches the rod and end thread sizes of your gas spring. Temperature range is -22° to 176°F, unless noted.

Steel gas springs have a steel body and rod and a rubber seal.

316 stainless steel gas springs have excellent corrosion resistance in damp environments. The body and rod are 316 stainless steel. The seal is rubber.

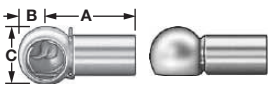
End Fittings and Brackets for Gas Springs

Select end fittings with a thread size that matches the rod and end thread sizes of your gas spring. The fittings will increase your gas spring's extended and compressed lengths, so add the (A) value for each fitting you attach.

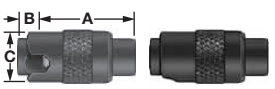
Ball Socket End Fittings



With Safety Clip

Snap-On

Quick-Release Press-On



Quick-Release Locking

Safety Clip

Thread these ball socket end fittings onto gas springs. They rotate in any direction on a ball stud to compensate for misalignment. Ball socket end fittings require a ball stud or ball stud mounting bracket (sold separately) to mount gas springs. **Stainless steel** fittings have excellent corrosion resistance in damp environments.

End Fittings with Safety Clip—The safety clip provides a secure attachment.

Snap-On—An integral retaining clip grips the ball stud for secure attachment until you apply enough force to pop it off.

Quick-Release—*Press-on* fitting has a button that you can press to secure and release attachment to your ball stud. *Locking* fitting has a spring-loaded socket that locks your gas spring to the ball stud; squeeze the ends together to attach and to release.

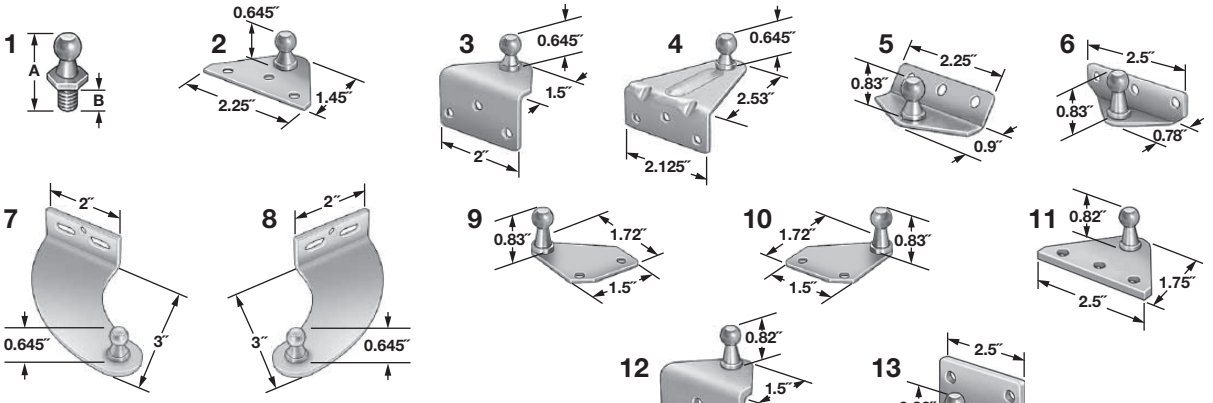
Mounting Ball Studs and Brackets



Mount your gas spring in almost any position—attach a ball socket end fitting (sold separately) onto the ball of these studs and brackets. **Stainless steel** studs and brackets have excellent corrosion resistance in damp environments.

Ball Studs—Mount directly into any panel, lid, or door.

Ball Brackets—Mounting fasteners are not included.

Zinc-plated steel and **stainless steel brackets** with a 10 mm ball have 0.2″ dia. mounting holes, except 0.14″ thick brackets have 0.22″ dia. holes. Brackets with 13 mm and 16 mm balls have 0.26″ dia. mounting holes.

Aluminum brackets are nonmagnetic and suitable for use near sensitive electronic applications. They do not have mounting holes and can be drilled to your customized hole pattern. Ball is zinc-plated steel.

(Continued on following page)

End Fittings and Brackets for Gas Springs *(Continued from previous page)*

Select end fittings with a thread size that matches the rod and end thread sizes of your gas spring. The fittings will increase your gas spring's extended and compressed lengths, so add the (A) value for each fitting you attach.

Eyelet End Fittings and Mounting Brackets

Attach an eyelet end fitting to one of these brackets (each sold separately) to mount your gas spring.

Eyelet end fittings require an eyelet mounting bracket or a pin to mount the gas spring. *316 stainless steel* fittings have excellent corrosion resistance in damp environments. *Nylon* fittings are good for use around flammable materials; they do not generate sparks. *Aluminum* fittings are nonmagnetic so they are suitable for use near sensitive electronic applications.

Eyelet mounting brackets have 0.24″ dia. mounting holes to mount on any panel, lid, or door. Fasteners are not included.

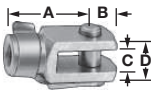
Clevis Fittings



A heavy duty alternative to eyelet fittings, these clevis fittings offer a bidirectional pivot point at the end of your gas spring. Clevis is zinc-plated steel and includes a zinc-plated steel spring pin.

Fitting Assortments for Gas Springs

M6 Threaded Assortment

Keep a convenient selection of gas spring fittings on hand—assortments include ball socket end fittings, eyelet end fittings, and ball studs.

M6 threaded assortment includes two steel ball socket end fittings with safety clips, two nylon snap-on ball socket end fittings with safety clips, two zinc eyelet fittings, and two steel ball studs.

9416K95 ..... $12.84

M8 threaded assortment includes two steel ball socket end fittings with safety clips, two nylon snap-on ball socket end fittings with safety clips, two zinc eyelet fittings, and four steel ball studs.

9416K96 ..... $17.12

M10 threaded assortment includes two steel ball socket end fittings with safety clips, two aluminum eyelet fittings, and two steel ball studs.

9416K98 ..... $44.00

Seal Protectors and Rod Bellows

Seal Protector

Rod Bellows

Guard the most vulnerable parts of your gas spring. All are made of rubber.

Seal Protectors—Prevent seal damage in dirty and dusty environments.

Rod Bellows—Avoid damage caused by impact and spills. Use the included clips to secure the bellows to your gas spring.

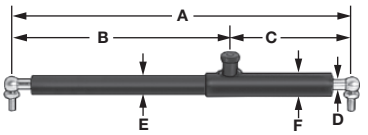
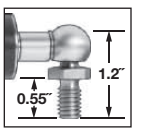
Locking Gas Springs





Protect material and equipment underneath heavy loads—these gas springs lock automatically when fully extended, ensuring they can't be closed until it's safe to do so. They're often used in critical lift-assist applications such as opening machine guards, access hatches, and storage compartments. Pull on the knob to unlock, allowing the gas spring to compress. Gas springs have a ball socket end fitting and ball stud on each end for mounting. Ball socket end fittings rotate in any direction on the ball stud to compensate for misalignment. The ball socket end fitting cannot be removed. The ball stud dia. is 10 mm.

The body, rod, ball socket, and ball stud are steel. Seal is rubber. Temperature range is -22° to 176° F.

Note: When using two gas springs together in a locking application, use one locking spring and one nonlocking spring.

Gas Springs

These general purpose gas springs assist in opening lids, covers, windows, conveyors, and seats—similar to a hatchback opening on a car. They have a ball socket end fitting and ball stud on each end for mounting. Ball socket end fittings rotate in any direction on the ball stud to compensate for misalignment.

Steel—The body, rod, ball socket, and ball stud are steel. Ball socket end fittings cannot be easily removed. The ball stud dia. is 10 mm. Temperature range is -22° to 176° F.

316 Stainless Steel—These gas springs are corrosion resistant for use in damp environments. All have a 316 stainless steel body and rod with a rubber seal. The ball socket is plastic and the ball stud is 300 series stainless steel, unless noted. The ball socket end fittings can be easily removed. Temperature range is -40° to 300° F, unless noted.

★ Ball socket and ball stud are 304 stainless steel. Temperature range is -13° to 158° F.

High-Temperature Gas Springs

A high-temperature seal allows these gas springs to withstand heat up to 392° F. They have a ball socket end fitting and ball stud on each end for mounting. Ball socket end fittings rotate in any direction on the ball stud to compensate for misalignment. The ball socket end fittings can be easily removed. Ball stud dia. is 10 mm.

The body, rod, ball stud, and ball socket are all steel. Temperature range is 4° to 392° F.

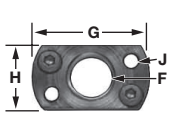
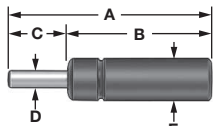
High-Force Miniature Gas Springs

Small in size, but not in strength, these gas springs are often used to replace coil springs in metal stamping and die-spring applications. They match the diameter and stroke length of coil die springs, but offer much more force. Mount with the threaded hole on the end; fasteners are not included. All have a steel body and rod. Seal is urethane rubber. Temperature range is 32° to 180° F.

Mounting flanges (sold separately) are for mounting gas springs through a panel or between two surfaces. Use included hardware to secure the gas spring to the flange at one of the two grooves on the gas spring body.





To Order: Please specify extension force from those available below. These gas springs are color-coded by force to help you choose the correct replacement gas spring.

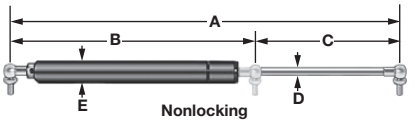
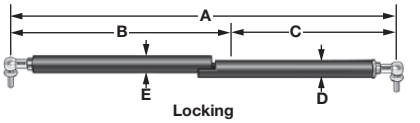
Reducible-Force Gas Springs

Ensure you have the correct force for your application. These gas springs have a bleed valve so you can release gas to permanently reduce the force to meet your requirements. They come charged to their maximum force. Use the included tool to open the valve and bleed off the gas—there's no disassembly required. Release gas in very small increments and then test your application. Once gas is released, the force is permanently reduced.

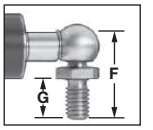
Steel Gas Springs



Nonlocking



Locking



Gas springs have a ball socket end fitting and ball stud on each end for mounting. Ball socket end fittings rotate in any direction on the ball stud to compensate for misalignment. The body, rod, ball stud, and ball socket are all steel. Seal is rubber. Temperature range is -40° to 212° F.

Locking gas springs are used to protect material and equipment underneath heavy loads. They lock automatically when fully extended, ensuring they can't be closed until it's safe to do so. Press on the overlapping sleeve to unlock, allowing the gas spring to compress in a controlled manner.

Note: When using two gas springs together in a locking application, use one locking spring and one nonlocking spring.

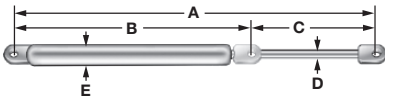
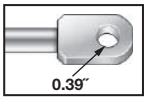
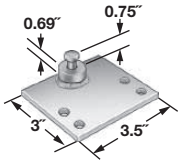
Stainless Steel Gas Springs with Eyelet Fittings

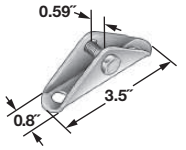


Gas Spring (Shown with Rod Protector)





Style 1 Mounting Bracket



Style 2 Mounting Bracket

Made from 316 stainless steel for excellent corrosion resistance in damp environments. These gas springs have an 18-8 stainless steel eyelet end fitting on each end; require an eyelet mounting bracket (sold separately below) for mounting. The eyelet end fittings can be easily removed. Seal is rubber. Temperature range is -40° to 300° F.

Rod protectors (sold separately) prevent impact damage. All are 316 stainless steel.

Regulator kits (sold separately) indicate how much gas you're releasing. Kits contain fittings to connect to your gas spring, a pressure gauge, a manifold, and instructions.

Mounting brackets do not include fasteners. *Style 1* is 18-8 stainless steel. *Style 2* is 304 stainless steel.

Remote-Release Gas Springs

Pair one of these gas springs with a release control to stop and release the gas spring anywhere along the stroke with the push of a button or lever.

Gas springs have a valve on the rod end that controls extension and compression and is operated with a release control (sold separately). They have a ball socket end fitting and ball stud on one end for mounting. The ball socket end fitting rotates in any direction on the ball stud to compensate for misalignment. The ball socket end fitting can be easily removed. Ball stud dia. is 13 mm. The body, rod, ball socket, and ball stud are steel. Seal is rubber. Temperature range is -22° to 176°F.

Release controls (sold separately) thread onto the rod end of the gas spring. They have an integral eyelet fitting for mounting the gas spring. The eyelet hole diameter is 0.32″. *Push-button release control* requires an eyelet mounting bracket (not included; see page 1264) to mount the gas spring. It has a 2″ body. *Lever release control* requires a bolt or pin (not included) to mount the gas spring. It is 5¼″ long.

Miniature Gas Springs with Eyelet Fittings

Sized with short stroke lengths and miniature dimensions, these gas springs are for opening small lids and doors, like those on toolboxes and access panels. They have an eyelet end fitting on each end; require an eyelet mounting bracket (sold separately) for mounting. The rod-end eyelet fitting is removable and the rod thread size is M4. Temperature range is -13° to 158°F.

Steel—The body and rod are steel with a rubber seal. Eyelet fittings are aluminum.

316 Stainless Steel—These gas springs have excellent corrosion resistance for use in damp environments. The body, rod, and eyelet fittings are 316 stainless steel. The seal is rubber.

Mounting Brackets—Mount on any panel, lid, or door. Fasteners are not included. *Style 1* includes a retaining ring.

Pulling Gas Springs

Also known as tension and traction gas springs, these work in the opposite direction of other gas springs. Similar to a screen door closing, they're used to assist in closing covers, hoods, and doors. These gas springs have a ball socket end fitting and ball stud on each end for mounting. Ball socket end fittings rotate in any direction on the ball stud to compensate for misalignment. The ball socket end fittings can be easily removed. Ball stud dia. is 13 mm. The body, rod, ball socket, and ball stud are steel. Seal is rubber. Temperature range is -22° to 176°F.

Threaded-Body Shock Absorbers

About Selecting Shock Absorbers

$$\text{Energy Cap. (in.-lbs.)} = \frac{\text{Weight (lbs.)}}{772} \times \text{Velocity}^2\ \text{(in. per second)}$$

To select the best shock absorber for your application, you need to find the energy capacity your application requires. Use this formula to calculate the energy capacity required to stop a horizontal-moving load. For example, if you have a 250-lb. load moving at 25 inches per second, your calculation is (250 lbs. ÷ 772) × 25^2 = 202.4 in.-lbs. energy capacity.

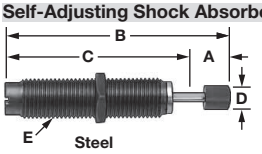
Note: Choose a shock absorber with a higher energy capacity than you calculated. Factors such as driving force or an inclined surface will increase the energy capacity required.

Threaded-Body Shock Absorbers

Install shock absorbers in gantry systems, presses, and at stops along conveyors—they counteract the energy of moving objects to prevent damage to equipment and material. All are filled with hydraulic fluid and come with a hex mounting nut. Use Threaded Mounting Blocks and Nuts for Shock Absorbers (not included, see page 1269) for mounting.

Nylon and **urethane rubber bumpers** are nonmarring. **Aluminum bumpers** are nonmagnetic.

Self-Adjusting Shock Absorbers



Accommodate changing loads and energy without manual adjustment. Shock absorbers have a stainless steel rod, unless noted.

Steel shock absorbers have a black-oxide finish, unless noted. Temperature range is 32° to 150° F, except shock absorbers with an aluminum bumper have a temperature range of -22° to 140° F and shock absorbers with a urethane rubber bumper have a temperature range of 14° to 176° F.

Corrosion-resistant stainless steel shock absorbers are excellent for use in damp environments. Temperature range is -20° to 140° F.

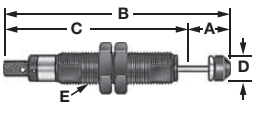
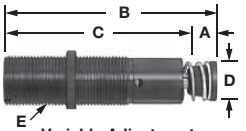
★ Does not have a bumper. ■ Has a black ultra-corrosion resistant coating. ▲ Rod is chrome-plated steel. Includes two hex mounting nuts.

Adjustable Shock Absorbers



Four-Position Adjustment



Variable Adjustment

Change deceleration to suit varying loads and speeds—turn the knob on these shock absorbers to adjust return speed. They have a chrome-plated steel rod, unless noted.

Four-position adjustment shock absorbers are steel with a black oxide finish. They come with two hex mounting nuts. Temperature range is 14° to 176° F.

Variable adjustment shock absorbers have a temperature range of 32° to 150° F. *Aluminum* shock absorbers have a black anodized finish; *steel* shock absorbers have a black ultra-corrosion resistant coating.

♣ Rod is nickel-plated steel. ♦ Rod is stainless steel.

For information about selecting shock absorbers, see page 1268.

Threaded Mounting Blocks and Nuts for Shock Absorbers

Mount threaded-body shock absorbers with these mounting blocks. Use the mounting nuts (sold separately) to secure.

Mounting blocks are steel.

Mounting nuts are hex style, unless noted.

Flange-Mount Adjustable Shock Absorbers

Change deceleration to suit varying loads and speeds—turn the knob on these shock absorbers to adjust return speed. They counteract the energy of moving objects to prevent damage to equipment and material. They're commonly used in gantry systems, presses, and conveyor stops. Both of these hydraulic shock absorbers have an enameled steel body with a chrome-plated steel rod. Bumper is urethane rubber, which is nonmarring. Temperature range is 14° to 176° F.

Light Duty Adjustable Shock Absorbers

Also known as snubbers, use these shock absorbers in low-load, high-cycle applications. They use a cushion of air to counteract the energy of moving objects to prevent damage to equipment and material. Turn the knob to adjust the return speed for changing loads and speeds. Body is rubber-coated borosilicate glass. Temperature range is -67° to 158° F.

Stud-mount shock absorbers have a stud and nut under the removable knob for mounting through a panel or bracket. The stud is 1/8″ long with a 3/8″-32 thread size. Rod is urethane.

Flange-mount shock absorbers have an acetal rod.

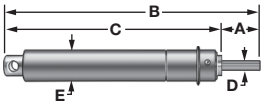
Shock Absorbers & Adjustable Air Springs

For information about selecting shock absorbers, see page 1268.

Leak-Resistant Adjustable Shock Absorbers



An airtight seal prevents leaks and protects moving parts from dust to minimize wear for a long service life. These shock absorbers decelerate fast-moving equipment without bang or bounce to prevent damage to equipment and material. You can change the deceleration to suit varying loads and speeds—turn the knob to adjust return speed. Shock absorbers have a steel body filled with silicone fluid. Rod is stainless steel. Temperature range is 40° to 130°F.

Mounting block is aluminum. Mounting hole diameter is 0.39″.

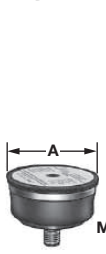
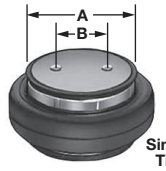
Adjustable Air Springs

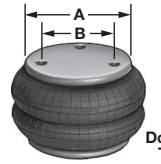


Miniature Sleeve

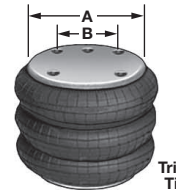
Sleeve



Single Tire



Double Tire



Triple Tire

Inflation Valve (Sold Separately)

Isolate vibration and absorb shock from moving equipment, even with changing loads. Also for leveling and lifting, use compressed air to adjust air springs to the height and force required for your application. They're often used with vibratory screen and conveyors; loading and transfer stations; and sensitive testing and measuring equipment. Install them in any mounting orientation. Maximum pressure is 100 psi. Air springs are made of neoprene rubber and have a temperature range of -20° to 135°F, unless noted.

Miniature sleeve air springs have a 1/8 NPTF male air inlet. Not rated for minimum pressure.

Sleeve air springs have a 1/8 NPTF male air inlet. They require 10 psi minimum pressure.

Single-tire, double-tire, and **triple-tire** air springs have a 1/4 NPTF female air inlet. Not rated for minimum pressure.

ⓘ For additional information about these air springs, including mounting dimensions and performance data, go to mcmaster.com and search for a part number.

★ Material is natural rubber. Minimum temperature is -56°F. ■ Spring has threaded mounting studs rather than holes on top mounting plate.

About Extension Springs

Holding a hatch door closed, tensioning a cable, and returning an air cylinder to its starting point are a few uses for extension springs. The more you stretch (or extend) the springs, the greater the force the springs will exert to pull the two points back together.

Extension springs are made of steel music wire (for high strength), spring-tempered steel (for heat resistance), or stainless steel (for corrosion resistance). They are available with loop and hook ends.

Minimum Load—The pounds of force it takes to start to extend the spring.

Maximum Load—The pounds of force it takes to fully extend the spring.

Rate—As you stretch an extension spring, it gets harder to pull. The higher the rate, the harder it is to stretch the spring.

Extension Spring Anchor Studs

Standard

Swiveling

Attach an extension spring to a stud, and then thread the stud into your part for a secure connection. **Steel studs** have a black-oxide finish for mild rust resistance. **18-8 stainless steel studs** offer excellent corrosion resistance.

Swiveling Studs—Have a head that swivels 360° so the spring stays straight and properly coiled.

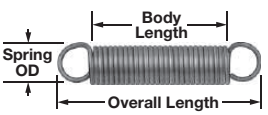
Custom Extension Springs



9533K21 Hook

9533K81 Loop

9533K41 Double Loop

9533K71 Side Loop

Whatever the size, we'll get the spring you need. Send us a description, drawing, or sample of the extension spring you require.

To Order: Please specify the following: 1) Part number for the spring end style; if you don't see your end style, use 9533K999. 2) Material: music wire, spring-tempered steel, stainless steel, or other material. 3) Finish: plain, zinc plated, or passivated (for stainless steel only). 4) Dimensions: overall length, body length, spring OD, and wire diameter.

Precision Extension Springs with Hook Ends

Springs are manufactured to specific OD, extended length, minimum load, and rate tolerances.

Zinc-Plated Steel Music Wire Springs—Meet ASTM B633 and offer some corrosion resistance.

Black-Oxide Steel Music Wire Springs—Are treated for durability and rust resistance.

Type 302 Stainless Steel Springs—Meet ASTM A313 and offer excellent corrosion resistance.

Also Available: Springs with a certificate of compliance. Please ask for 9432K999 for steel music wire springs or 9433K999 for Type 302 stainless steel springs and specify the spring part number.

Specification	Tolerance
OD: 0.094″ to 0.188″	+0.003″/–0.005″
OD: 0.25″ to 0.5″	±0.008″

Ultra-Precision Extension Springs with Loop Ends

When extremely tight OD and rate tolerances are critical, these are the springs to choose. All offer outstanding wear resistance, which makes them perfect for applications in motion.

Type 302 Stainless Steel Springs—Offer excellent corrosion resistance.

Also Available: Springs with a certificate of compliance. Please ask for 9044K999 for steel music wire springs or 9065K999 for Type 302 stainless steel springs and specify the spring part number.

Specification	Tolerance

Cut-to-Length Extension Springs

Keep these long springs on hand so you can cut the right length whenever you need it. All of these springs have straight-cut ends, which allow you to bend the end coils into hook or loop ends. To determine the spring rate, take the rate constant and divide it by the length (in inches) you cut.

Type 302 Stainless Steel Springs—Offer excellent corrosion resistance.

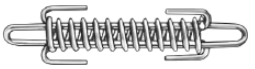
Safety Extension Springs



While ordinary extension springs can be overloaded to failure, these springs have drawbars to safeguard against overextending.

Zinc-Plated Spring-Tempered Steel Springs—Offer some corrosion resistance.

Type 302 Stainless Steel Springs—Offer excellent corrosion resistance.

Extra-Stretch Extension Springs

Designed to go the distance, these springs stretch up to three times their original length—much further than traditional extension springs, tie downs, and shock cords. The springs are made of rubber tubing that's encapsulated in a polypropylene fabric sleeve. All have 2″ long, zinc-plated steel hooks with a 5/16″ spring-loaded latch opening at each end. Do not use them to hold overhead loads. Operating temperature range is 30° to 130° F.

Spring Assortments

Keep a variety of springs on hand. Extension springs have hook or loop ends; compression springs have open, closed, or closed and ground flat ends.

Assortments in plastic boxes, **steel cabinets**, and **plastic cabinets** are divided into compartments and most have a chart on the lid that identifies the spring for each compartment.

To Order: For refill springs, please ask for the refill spring part number listed below, and specify the spring number (if provided on the chart located on the inside lid of your container) or the spring length, OD, and wire diameter desired.

No. of Springs	No. of Sizes	Spring Material	*Spring Size Range* Length	OD	Wire Dia.	Container	Assortments	Refill Springs

Constant-Force Springs

Typically used as retractors in tape measures and cable reels, these springs are wound into a tight coil to provide uniform force throughout extension and retraction. They can be wrapped around a shaft, spool, or rod; allow for 1½ extra coils on the shaft at full extension to hold the spring in place. All of these springs are made of Type 301 stainless steel. The free end has one hole for attaching a load to the spring. Wound ID, wound OD, and load tolerances are ±10%.

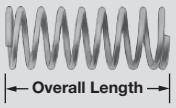
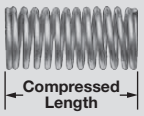
About Compression Springs



Closed Ends



Closed and Ground Flat Ends

When a compression spring is pushed together (compressed), it pushes back to return the spring to its original length. They're commonly used in shock absorbers and to secure batteries.

Compression springs are made of steel music wire (for high strength), spring-tempered steel (for heat resistance), or stainless steel (for corrosion resistance). They are available with closed ends as well as with closed and ground flat ends. On springs with closed ends, the last two coils are close together. On springs with closed and ground flat ends, the last coil is flush so the springs stand straighter and are easier to stack.

Rate—As you push a compression spring, it gets harder to push. The higher the rate, the harder it is to compress the spring.

Note: Spring ID = Spring OD − (Wire Dia. × 2).

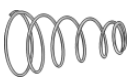
Confined-Space Conical Compression Springs



When pushed together, the coils of these cone-shaped springs nest within each other to provide a near constant spring rate and a shorter compressed length than a normal compression spring. All springs are made of Type 302 stainless steel and have closed ends.

Precision Compression Springs

Use these springs in applications where tight OD and rate tolerances are required. All springs have closed and ground flat ends.

Type 302 Stainless Steel Springs—Offer excellent corrosion resistance.

Also Available: Springs with a certificate of compliance. Please ask for 9434K999 and specify the spring part number.

Specification	Tolerance
OD: 0.120″ to 0.250″	+0.003″/–0.005″
OD: 0.251″ to 0.599″	±0.008″
OD: 0.600″ to 0.720″	±0.015″
Rate, lbs./inch	±8%

Ultra-Precision Compression Springs

The choice for extremely tight OD and rate tolerances. All springs have closed and ground flat ends.

Type 302 Stainless Steel Springs—Offer excellent corrosion resistance.

Also Available: Springs with a certificate of compliance. Please ask for 9001T999 for steel music wire springs or 9002T999 for Type 302 stainless steel springs and specify the spring part number.

Specification	Tolerance
OD: 0.12″ to 0.18″	±0.002″
OD: 0.181″ to 0.24″	±0.003″
OD: 0.241″ to 0.50″	±0.004″
OD: 0.501″ to 0.72″	±0.005″
Rate, lbs./inch	±5%

Cut-to-Length Compression Springs

Keep these long springs on hand so you can cut the right length whenever you need it. All have open ends. To determine the spring rate, divide the rate constant by the length you cut.

Shock-Absorbing Plastic Compression Springs

Don't let their small size fool you—these springs absorb the maximum amount of impact in the minimum amount of space. All are polyester-based elastomer, which is 10 times more durable than most rubber and 20 times more durable than polyurethane. They also resist gasoline, oil, and diesel fuel. Mount them with a screw (not included) in indoor and outdoor applications. Temperature range is –40° to 120° F. Color is black.

Energy is calculated in one of two ways. For an object that is dropped, energy equals the weight of the item multiplied by distance dropped. For an object moving in a horizontal direction, energy equals half of the mass of the item multiplied by velocity squared (½ mv^2).

Peak dynamic force is the load on the spring when it is fully compressed at its rated energy.

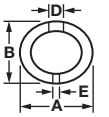
High and Medium Load



Low Load

High-Load Compression Springs

With their unique wave design, these springs handle heavy loads in less space than conventional compression springs. Use them in valves, quick-disconnect couplings, or anywhere space is at a premium. All are made of carbon steel and have shim ends, which provide a flat mounting surface. Note: Overall length is approximate.

Metric Compression Springs

In addition to meeting rigorous DIN 2095 specifications, these springs are made to precise OD and rate tolerances. All have closed ends; springs with a wire diameter of 1.00 mm and larger also have ground flat ends.

Steel Music Wire Springs—Meet DIN 17223.

Type 302 Stainless Steel Springs—Meet DIN 17224 and offer excellent corrosion resistance.

Also Available: Springs with a certificate of compliance. Please ask for 94125K999 and specify the spring part number.

Specification	Tolerance
OD: 4.1 mm to 6.3 mm	±0.3 mm
OD: 6.4 mm to 10.0 mm	±0.35 mm
OD: 10.1 mm to 16.0 mm	±0.4 mm

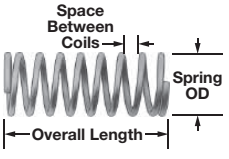
Custom Compression Springs



9534K21 Open Ends

9534K41 Closed Ends

9534K31 Open and Ground Ends

9534K51 Closed and Ground Flat Ends

Whatever the size, we'll get the spring you need. Send us a description, drawing, or sample of the compression spring you require.

To Order: Please specify the following:

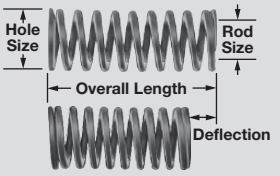
1. Part number for the spring end style shown at left.
2. Material: steel music wire, spring-tempered steel, stainless steel, or other material.
3. Finish: plain, zinc plated, or passivated (for stainless steel only).
4. Dimensions: overall length, spring OD, wire diameter, and space between coils.

About Die Springs

Die springs are a special type of compression spring that are made from rectangular wire to withstand heavy loads with minimum deflection (the distance the spring compresses). Use them to make and maintain dies, die sets, punching tools, stamping tools, and jigs. A general rule for die springs is to use several short springs rather than one long spring for the least amount of spring compression.

Deflection—The distance a spring compresses when a given load is applied. It is commonly expressed as a percentage of the overall length.

Rate—As you push a die spring, it gets harder to push. The higher the rate, the harder it is to compress the spring.



High-Performance Chrome-Silicon Steel Die Springs

Manufactured to handle repetitive punching and stamping jobs, these springs have high tensile strength for reliable, consistent operation over a long lifetime. Ends are closed and ground flat so springs stand straight and are easy to stack. They follow the Raymond die springs color code.

Fits Hole Size	Fits Rod Size	O'all Lg.	Wire Ht.	Wire Wd.	Load, lbs.	Rate, lbs./ inch		
Blue, Medium Load—Load at 25% deflection. Max. deflection is 50%.

(Continued on following page)

High-Performance Chrome-Silicon Steel Die Springs *(Continued from previous page)*

Manufactured to handle repetitive punching and stamping jobs, these springs have high tensile strength for reliable, consistent operation over a long lifetime. Ends are closed and ground flat so springs stand straight and are easy to stack. They follow the Raymond die springs color code.

Fits Hole Size	Fits Rod Size	O'all Lg.	Wire Ht.	Wire Wd.	Load, lbs.	Rate, lbs./ inch

Spring-Tempered Steel Die Springs

Use these springs in low-cycle die press applications such as trimming and stamping. All have closed and ground flat ends so they stand straight and are easy to stack. Maximum deflection is 15%.

Heavy-Load Alloy Steel Die Springs

Larger than typical die springs, these offer greater stability while taking on your heavy loads. All have high tensile strength for reliable operation over a long lifetime. Ends are closed and ground flat so springs stand straight and are easy to stack.

Corrosion-Resistant Polyurethane Die Springs

A quieter, more vibration-resistant alternative to traditional steel die springs, these are made of polyurethane to resist oxidation, oil, and abrasion in high load, high pressure applications. Maximum deflection is 15%. Durometer is 95A. Temperature range is –50° to 180° F.

Cut-to-Length Die Springs

Keep these 36″ long springs on hand so you can cut the right length whenever you need it. All have open ends. To determine the spring rate, divide the rate constant by the length (in inches) you cut.

Die-Spring Cages

Protect dies from damage caused by spring failure. Cages enclose springs and retain fragments if they should break. All are made of 0.049″ thick steel.

Cage Shown with Spring

Length	0.75″ ID		1″ ID		1.25″ ID		1.5″ ID		2″ ID

Die-Spring Screw Caps

In addition to providing a backing for springs, these screw caps can also be used to control spring tension. Install them by drilling and tapping a hole through your die set. All screw caps are made of hardened steel and have a black-oxide finish.

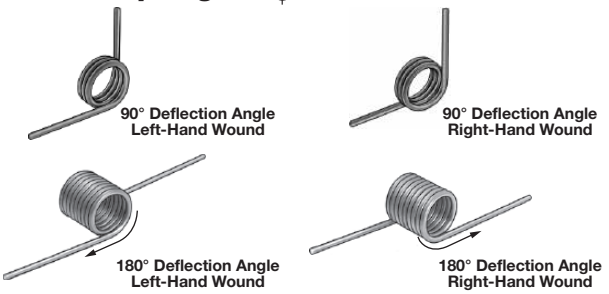
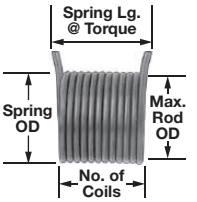
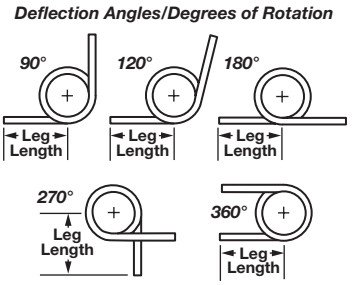
Torsion Springs







Commonly found in clothespins, spring clamps, mousetraps, motors, and spring-return mechanisms, torsion springs maintain pressure over a short distance in a rotational direction. They are often supported by a rod, mandrel, or arbor.

Squeezing a torsion spring reduces the spring OD, which tightens the spring around a shaft and increases the spring length. Since the spring gets tighter as it is squeezed around the shaft, a maximum rod OD for each spring is listed. Using a larger rod OD will interfere with the spring motion.

Torsion springs should be used in the direction in which the coils are wound. Choose from five different deflection angles/degrees of rotation. Each represents the angle between the legs of the spring as well as the maximum spring rotation. All springs rotate until their legs are parallel. For example, a spring with a 90° deflection angle/degrees of rotation has a 90° angle between its legs, and it will rotate a maximum of 90°. Torque, in.-lbs. is the torque required to rotate the spring legs to the parallel position. Spring length @ torque is the length of the spring at that time.

Steel music wire torsion springs have high strength. **Type 302 stainless steel torsion springs** offer good corrosion resistance.

To Order: Please specify right-hand or left-hand wind direction.

Custom Torsion Springs

Whatever the size, we'll get the spring you need. Send us a description, drawing, or sample of the torsion spring you require. For information about torsion spring specifications, please refer to the illustrations shown on page 1292.

To Order: Please specify the following:
1. Part number for the deflection angle listed at right.
2. Wind direction: right-hand or left-hand.
3. Material: music wire, stainless steel, or other material.
4. Finish: plain or zinc plated.
5. Dimensions: spring OD, wire diameter, leg length, and number of coils.

Deflection Angle	
90°	9535K21
120°	9535K71
180°	9535K31
270°	9535K41
360°	9535K51

Spring Tools

Spring Winder Kits—Wind your own extension, compression, and torsion springs with 1/8″ to 1 1/4″ IDs. Tools handle round, square, and flat wire with a maximum diameter or thickness of 3/16″. They include a pitch gauge and wire holder.

Master kit includes a winder; a cam lock tension release; two handles for large and small mandrels; six 12″ long mandrels in 1/8″, 1/4″, 3/8″, 1/2″, 5/8″, and 3/4″ sizes; a wrench; four 1/4-lb. coils of 0.029″, 0.047″, 0.067″, and 0.085″ dia. spring wire; a spring end-looping tool; and a multipurpose nipper that cuts wire up to 0.100″ dia.

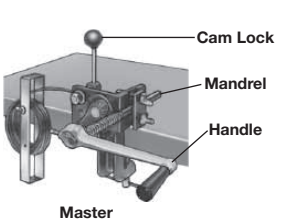
General purpose kit is the same as the master kit, but doesn't include a looping tool and nipper.

Utility spring kit includes a winder; one handle; a wrench; and four 12″ long mandrels in 1/8″, 1/4″, 3/8″, and 1/2″ sizes.

Spring Winder Tool—For use with a lathe and mandrel, this winder handles round, square, and flat wire with a maximum diameter or thickness of 3/16″. Wire tension and the distance between turns are adjustable. Overall length is 7″.

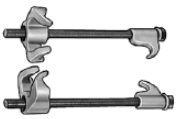
Spring End-Looping Tool—Form loop and hook ends on coiled extension springs with 1/8″ to 1/2″ ODs and up to 0.062″ wire diameter or thickness. Includes an adjustable stop with wrench; small and large forming punches. Overall length is 6 1/2″.

Spring Compressor Set—Steel jaws hook onto compression or die springs to facilitate installation and removal. One set includes two compressors. Overall length is 12 1/4″.



Master Spring Winder Kit

Spring End-Looping Tool



Spring Compressor Set

Master Spring Winder Kit	9676K1	$411.67
General Purpose Spring Winder Kit	9676K4	298.33

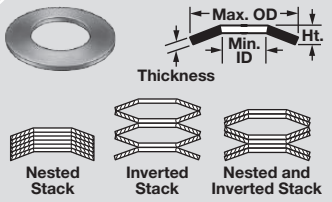
Spring Winder Tool	9527K11	98.00
Spring End-Looping Tool	9674K3	117.31
Spring Compressor Set	6241A77	47.07



About Belleville Disc Springs

Hold large loads in small spaces. These conical springs are often used under bolt heads to maintain tension and keep the bolt from loosening. They're also used to maintain tension at the ends of valves and bearings. Compared to Belleville washers, these repeatedly return to their original height once working loads are removed.

Use springs singly, or stack as shown to increase load and deflection (the distance the spring compresses). In a nested stack, the load is increased by the number of springs used. In an inverted stack, the deflection is increased by the number of springs in the stack, while retaining the load of only one across the span of the stack. In a nested and inverted stack, both load and deflection are increased.

Deflection @ Working Load—Distance the spring compresses when the given load is applied.

Flat Load—Load at which the spring is completely compressed.

Belleville Disc Springs

Steel springs are high-carbon steel for strength, unless noted.

Stainless steel springs offer corrosion resistance. Springs that are under 0.073″ thick are made of 300 series stainless steel. Springs with a thickness of 0.073″ and larger are made of 17-7 PH stainless steel.

Min. ID	Max. OD	Thickness	Ht.	Defl. @ Working Load	Working Load, lbs.	Flat Load, lbs.	Steel Pkg. Qty.	Steel	Steel Pkg.	Stainless Steel Pkg. Qty.	Stainless Steel	Stainless Steel Pkg.

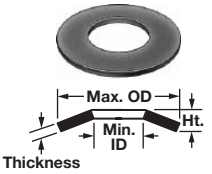
Metric Belleville Disc Springs



All of these springs are made to the requirements of DIN 2093.
High-carbon steel offers strength.
Chrome-vanadium steel provides strength as well as wear resistance.
Type 17-7 PH stainless steel offers corrosion resistance.

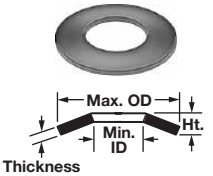
High-Temperature Belleville Disc Springs



Cold and hot environments are no problem—these springs can withstand temperatures from –400° to 1100°F. All are made of Inconel, a high-strength nickel alloy with excellent corrosion resistance. Working load and flat-load tolerances are ±20%.

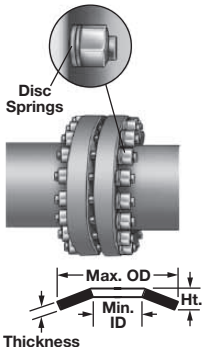
Belleville Disc Springs for Flange Bolts



In addition to maintaining tension and preventing bolts from loosening, these springs absorb force from flange movement caused by mechanical shock and thermal expansion and contraction. They are designed to fit flange bolt sizes. All are made from 17-7 PH stainless steel for good corrosion resistance.

Belleville Disc Springs for Ball Bearings

Install these springs, also known as bearing preload washers, against ball bearings to handle loads as well as reduce noise and end movement of the bearings. These springs are not rated for flat load.

High-carbon steel offers strength.

Chrome-vanadium steel provides strength as well as wear resistance.

Wave Disc Springs

Choose these wave-shaped springs to hold light loads in small spaces. Also known as wave spring washers, they're also great for use with ball bearings because they handle loads as well as reduce noise and end movement of the bearings.

High-carbon steel offers strength.

Type 302 stainless steel offers corrosion resistance.

Curved Disc Springs

Made to fit standard rod and hole sizes, curved disc springs handle light loads in small spaces. They are often used to reduce end movement of bearings and other parts.
High-carbon steel offers strength.
Type 301 stainless steel offers corrosion resistance.

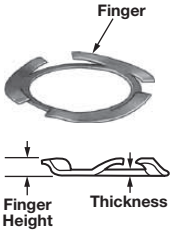
Finger Disc Springs



You'll get the flexibility of disc springs and the load strength of wave springs in these finger springs. They're designed to absorb vibration as well as reduce noise, end movement, and skidding wear on parts rotating at high speeds. Springs are made from Grade 1074 high-carbon steel for strength. They have six 0.125" high fingers (except spring with a bearing OD of 0.630" has three 0.0937" high fingers).

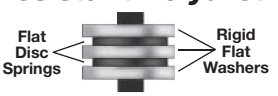
Corrosion-Resistant Polyurethane Flat Disc Springs



Stacked Springs

Able to hold high loads in small spaces, similar to Belleville springs, these springs resist oxidation, oil, and abrasion. Durometer is 95A with a tolerance of +5. Load tolerance is ±25%. Deflection range is 0-10% for static applications; 0-20% for dynamic applications.

When stacked, these springs must be separated by rigid flat washers (see illustration). The washers must be large enough to cover the entire surface of the disc springs. For washers, see 98017A on page 3252.

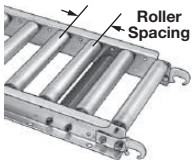
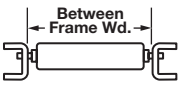
Roller Conveyors and Stands

Easily move light-to-medium weight flat- and uneven-bottom objects. *Note:* Capacities are based on an evenly distributed load with a stand at each end. Capacities for 10-ft. lengths can be increased to those listed for 5-ft. lengths by adding a center stand. The length of the material you're conveying should be at least three times the roller spacing.

Conveyors





Roller Conveyor Profile

Frames are 2½" high and have two hooks at one end to connect conveyor sections. Rollers have ¼" dia. spring-loaded axles and steel ball bearings.
1⅜" dia. rollers project 3/16" above the frame. Overall conveyor height is 2 11/16".
1.9" dia. rollers project ½" above the frame. Overall conveyor height is 3".
Steel conveyors are stronger than aluminum and have a galvanized finish.
Aluminum conveyors are lighter than steel with better corrosion resistance.
Also Available: 90° curves. Please ask for 5825K777 and specify conveyor overall width, roller diameter, and material (steel or aluminum).

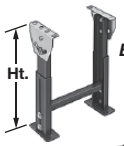
Stands



Stands are steel with a blue powder-coated finish. *Note:* Stands are compatible only with the conveyors listed above.
Bolt-On—Stands attach to conveyor frames with 5/16"-18 bolts (not included). Mounting plates adjust to allow you to set the conveyor at a decline.
Portable—Conveyor rests on top of the stand.
Mobile—Stands have four swivel casters with brakes. Conveyor rests on top of the stand.

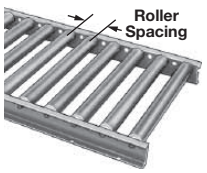
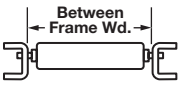
Washdown Roller Conveyors and Stands

Suitable for food equipment and washdown applications, conveyors are made of stainless steel and meet USDA standards. *Note:* Capacities are based on an evenly distributed load with a stand at each end. Capacities for 10-ft. lengths can be increased to those listed for 5-ft. lengths by adding a center stand. The length of the material you're conveying should be at least three times the roller spacing.

Conveyors





Roller Conveyor Profile

Rollers are 1⅝" dia. and project 5/16" above the frame. Roller spacing is 3". Frames are 2½" high. Overall conveyor height is 2 13/16". To join conveyor sections, use a common stand. Rollers have 7/16" hex spring-loaded axles and plastic-encased stainless steel ball bearings.
Also Available: 90° curves. Please ask for 5811K777 and specify conveyor overall width.

Heavy Duty Roller Conveyors and Stands

Choose these durable steel conveyors for more demanding shipping and assembly applications. *Note:* Capacities are based on an evenly distributed load with a stand at each end. Capacities for 10-ft. lengths can be increased to those listed for 5-ft. lengths by adding a center stand. The length of the material you're conveying should be at least three times the roller spacing.

Conveyors

Rollers are 1.9″ diameter and project 1/4″ above the frame. Frames are 3 1/2″ high and have coupling plates to connect sections. Overall conveyor height is 3 3/4″. Frames have a green powder-coated finish. Rollers have 7/16″ hex spring-loaded axles and steel ball bearings.

Also Available: 90° curves. Please ask for 5746K888 and specify conveyor overall width.

Super Duty Roller Conveyors and Stands

Our strongest roller conveyors are built to handle the heaviest loads. Made of heavy-gauge steel. *Note:* Capacities are based on an evenly distributed load with a stand at each end. Capacities for 10-ft. lengths can be increased to those listed for 5-ft. lengths by adding a center stand. The length of the material you're conveying should be at least three times the roller spacing.

Conveyors

Rollers are 2 1/2″ diameter and project 1/4″ above the frame. Frames are 4″ high and have coupling plates to connect sections. Overall conveyor height is 4 1/4″. Rollers have 11/16″ hex spring-loaded axles and steel ball bearings that are double shielded to keep debris out and to extend bearing life.

Also Available: 90° curves. Please ask for 5747K888 and specify conveyor overall width.

Bench-Top Adjustable Roller Conveyors

Designed to rest on your work surface, these conveyors have two sets of axle holes so you can position the conveying surface 1/8″ above the frame or 3/4″ below the frame (position below to use the frame as a guide rail). *Note:* Capacities are based on an evenly distributed load. The length of the material you're conveying should be at least three times the roller spacing.

Rollers are 3/4″ dia. Roller spacing is 1″. Frames are 2 1/2″ high. Overall conveyor height is 2 5/8″. Rollers have 1/4″ dia. spring-loaded axles and steel ball bearings.

Steel conveyors are stronger than aluminum and have a galvanized finish.

Aluminum conveyors are lightweight and corrosion resistant.

Skate Wheel Conveyors & Ball Transfer Plates

For replacement skate wheels, see page 1310.

Lightweight Skate Wheel Conveyors and Stands

Easier to move than roller conveyors, skate wheel conveyors are for light duty loading and unloading of flat-bottom objects. *Note:* Capacities are based on an evenly distributed load with a stand at each end. Capacities for 10-ft. lengths can be increased to those listed for 5-ft. lengths by adding a center stand. The length and width of the material you're conveying should be at least three times the axle spacing.

Conveyors

Wheels are 1.9″ dia. and project 3⁄8″ above the frame. Frames are 2 1⁄2″ high and have hooks at one end to connect sections. Overall conveyor height is 2 7⁄8″. Axles are 1⁄4″ dia.; axle spacing is 3″. Wheels have steel ball bearings.

Steel frames are stronger than aluminum and have a galvanized finish. *Steel wheels* are durable and have a zinc-plated finish. *Plastic wheels* are nonmarring. Color is black. **To Order:** Please specify steel or plastic wheels.

Aluminum frames are lighter than steel with better corrosion resistance.

Also Available: 90° curves. Please ask for 56755K888 and specify frame material, skate wheel material (for steel conveyors), and conveyor overall width.

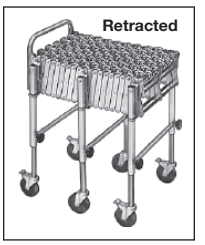
Flexible Skate Wheel Conveyors



Accordion-style side rails and swivel casters with brakes let you quickly curve, expand, and retract these conveyors. They have 1.9″ dia. skate wheels for flat-bottom objects in assembly lines or packaging and shipping applications. Wheels project 3⁄8″ above the frame. Axles are 5⁄16″ dia.; axle spacing is 5 1⁄4″ when the conveyor is fully expanded. Conveyors have a handle that stops boxes at one end and telescoping legs to adjust the height and brackets to connect sections. Frames are steel with a zinc-plated finish. *Note:* Capacities are based on an evenly distributed load.

Steel wheels have steel ball bearings for impact resistance.

Nylon wheels resist moisture and corrosion. Wheels are red and have nylon bearings.

Multidirectional Miniature Ball Transfer Plates

Also known as ball-bearing parallels, these transfer plates have multidirectional balls that project from the top and bottom to position and move small, heavy items over short distances. Plates are steel with a black-oxide finish and have 3⁄8″ dia. steel balls. Overall height is 3⁄8″.

Multidirectional Ball Transfer Plates

Rotate and position material on your floor or bench top. Plates are steel with a blue powder-coated finish and have 1″ dia. steel balls in zinc-plated steel housings. Overall height is 3″.

Note: The length and width of the material you're moving should be at least three times the ball spacing.

Replacement Ball Transfer 5689K41 $3.12

Multidirectional Ball Transfer Conveyors and Stands

Use these ball transfer conveyors alone or add them to the Heavy Duty Roller Conveyors on page 1301 to rotate and position material along your conveying line. *Note:* The length and width of the material you're conveying should be at least three times the ball spacing.

Conveyors

Balls project 1/4" above the frame. Frames are 3 1/2" high and have coupling plates at each end to connect conveyor sections. Overall conveyor height is 3 3/4". Frames are steel with a green powder-coated finish and have 1" dia. steel balls with zinc-plated steel housings.

Plates

Extend your ball transfer conveyor or add multidirectional functionality to your roller conveyor. Plates have 3/8" Wd. x 5/8" Ht. mounting slots (fasteners not included) and can be mounted to the axle holes of your roller conveyor once rollers are removed. Plates are steel with a green powder-coated finish and have 1" dia. steel balls with zinc-plated steel housings.

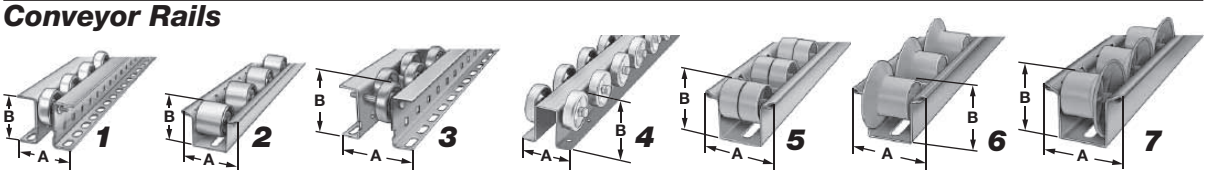
Conveyor Rails



When you don't need the support of a complete conveyor, these rails are a lightweight and economical solution. Use rails to convey packages and pallets in flow racks and in confined spaces.

Frames are galvanized steel. Wheels have steel ball bearings, except ABS plastic wheels, which have a plain bore (no bearings). For replacement wheels, see page 1310.

Styles 6 and *7* have flanged wheels that guide material. *Style 6* has flanges on the left side when facing the unloading end of the rail. *Style 7* has flanges on the right side when facing the unloading end of the rail.

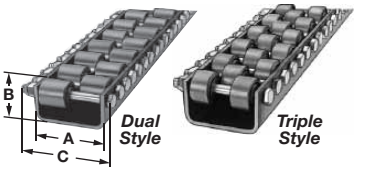
Heavy Duty Conveyor Rails

All-steel construction gives these rails the durability to carry heavy loads. Wheels have double ball bearings for handling high capacities and extending wheel life. Wheel spacing is 2 5/32". Frames and wheels have a plain finish. Rails can be drilled for mounting or welded in place.



Wheel Size: Dia.	Wd.	Cap., lbs./sq. in.	Frame Wd. (A)	O'all Ht. (B)	O'all Wd. (C)	5-ft. Lengths		10-ft. Lengths

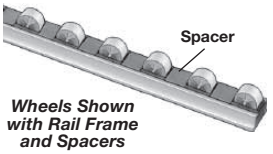
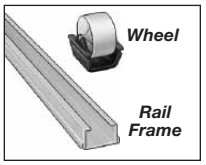
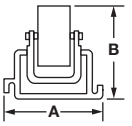
Build-Your-Own Corrosion-Resistant Conveyor Rails



Wheels Shown with Rail Frame and Spacers





Assemble your own lightweight conveyor rails that are suitable for washdowns. Wheels have a built-in bracket that snaps into the aluminum frame (sold separately). Frames can be cut to your desired length and drilled for mounting. They have interlocking sides so you can connect rails side by side. Minimum wheel spacing is 1 1/8". Use spacers (sold separately) to increase wheel spacing by 7/8". Multiple spacers can be used.

Wheels are acetal and have a plain bore (no bearings). Wheel diameter is 1". Color is red for *1/2" wide wheels* and white for *9/16" wide wheels*. Axle is stainless steel for *1/2" wide wheels* and nylon for *9/16" wide wheels*.

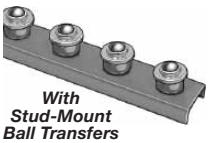
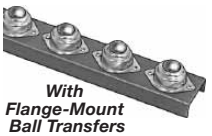
Multidirectional Conveyor Rails

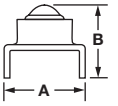
Ball Transfer Rails



With Stud-Mount Ball Transfers



With Flange-Mount Ball Transfers



Ball transfer rails let you rotate material in any direction. Frames are galvanized steel and have 1" dia. steel balls in zinc-plated steel housings. Weld rails in place.

Stud-mount ball transfers are attached to the rail with a 1/4"-20 stud and nut. For replacement ball transfers, see page 1311.

Flange-mount ball transfers are riveted in place.

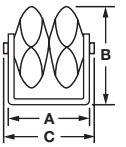
Skate Wheel Rails



Wheels have miniature rollers that move material across the width as well as the length of the rails. Frames are galvanized steel and have 1/4" dia. holes for mounting (fasteners not included). Wheels are 1.9" dia. and 15/16" wide. They're made of corrosion-resistant acetal and have a plain bore (no bearings). Color is gray. For replacement wheels, see page 1310.

Wheel Spacing	Cap., lbs./Wheel	Frame Wd. (A)	O'all Ht. (B)	O'all Wd. (C)	*5-ft. Lengths*		*10-ft. Lengths*

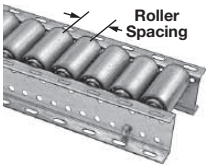
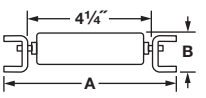
Roller Conveyor Rails with Package Stop



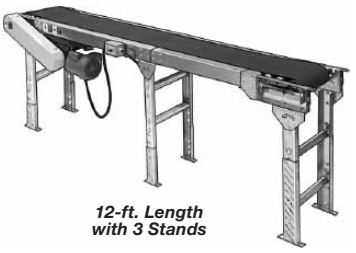


Roller Conveyor Profile

Support heavy loads in pallet flow and conveying applications. The removable package stop prevents material from falling off the rail. Frames and rollers are steel with a galvanized finish. Roller diameter is 1.9"; roller spacing is 2". Rollers have steel ball bearings. Mounting slots are 7/8" x 3/8" and spaced 2" center-to-center.

Cap., lbs./Roller	Frame Wd. (A)	O'all Ht. (B)	*5-ft. Length*		*10-ft. Length*	
200	6 1/2"	3 1/2"	5235T52	$160.83	5235T51	$315.83

Heavy Duty Belt Conveyors



12-ft. Length with 3 Stands

Move heavy boxes and irregularly shaped items in assembly line, sorting, and packing applications. Conveyors have a 3 1/2" high galvanized steel bed, a black PVC belt, and a 1/2-hp totally enclosed fan-cooled motor. Conveyors run at 60 fpm and include stands that adjust the overall conveyor height from 34" to 38". Frames have coupling plates to connect sections. *Note:* Capacities are based on an evenly distributed load.

120-volt AC conveyors have single-phase motors with an on/off switch and a 10-ft. power cord with a three-prong plug. *230/460-volt AC* conveyors have three-phase motors with connections for hardwiring. **To Order:** Please specify voltage.

Also Available: Conveyors with a 1/2-hp, 90-volt DC motor and a variable speed range of 7-60 fpm. Please ask for 5816K888 and specify belt width and conveyor length.

Also Available: Replacement belts and other replacement parts. For belts, please ask for 5816K666 and specify belt width and conveyor length. For other replacement parts, please ask for 5816K777 and specify belt width and part desired.

Belt Wd.	Frame Wd.	Available AC Voltage	*7-ft. Length with 2 Stands* Cap., lbs.			*12-ft. Length with 3 Stands* Cap., lbs.			*22-ft. Length with 4 Stands* Cap., lbs.

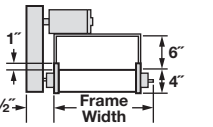
Bench-Top Belt Conveyors

A top-mount motor allows these conveyors to sit right on your bench top, so there's no need for brackets or stands. Guide rails extend 1″ above the conveyor's surface to keep parts from falling off the belt. Conveyors have a 4″ high steel bed, a brown neoprene belt, and a 1/4-hp motor. They operate on 120 volts AC and include a 12-ft. power cord with a three-prong plug.

Note: Capacities are based on an evenly distributed load.

Also Available: Replacement belts. Please ask for 5900K888 and specify belt width and conveyor length.



Belt Wd.	Frame Wd.	Cap., lbs.	Speed, fpm	5-ft. Lengths		10-ft. Lengths

Ready-To-Run Mini Belt Conveyors

Run these conveyors right out of the box—plug in and go. Also known as low-profile conveyors. Add surface-mounting brackets (sold separately) for countertop use or two stands (sold separately) for freestanding applications. *Note:* Capacities are based on an evenly distributed load.

Light Duty Aluminum Mini Conveyors

Lightweight and corrosion resistant, conveyors are made of aluminum with a stainless steel bed. T-slotted side rails let you quickly mount items to the conveyor without drilling. T-slot width is 10 mm. Conveyors have a 1 7/8″ high bed, an FDA-compliant white urethane belt, and a 1/30-hp motor. They operate on 120 volts AC.

Fixed-speed conveyors have a 7-ft. power cord with a three-prong plug.

Variable-speed conveyors have a 5-ft. power cord with a three-prong plug.

Also Available: Cleated belting. Please ask for 5734K999 and specify belt width, conveyor length, cleat height, and cleat spacing.

Also Available: Replacement belting. Please ask for 5734K91 and specify belt width and conveyor length.

Heavy Duty Steel Mini Conveyors

Steel construction and greater horsepower give these conveyors higher capacities and speeds. Conveyors have a 1 7/8″ high bed, aluminum side rails, an FDA-compliant white urethane belt, and a 1/3-hp motor. They operate on 120 volts AC and include an 8-ft. power cord with a three-prong plug. Frame has a tan powder-coated finish.

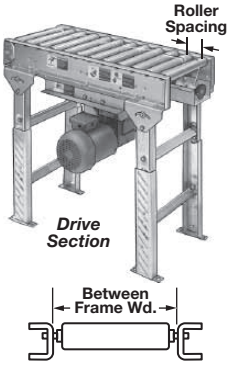
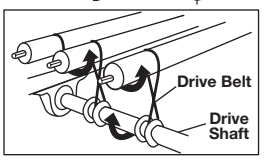
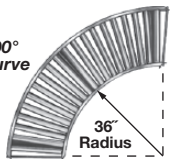
Powered Roller Conveyors







Also known as line-shaft and live-roller conveyors, these are driven by a common drive shaft and urethane belts. Conveyors run at a constant speed of 60 fpm. The drive shaft continues to run even when the accumulation of packages may cause some rollers to stop turning.

Rollers are 1.9″ dia. and have a single groove to accommodate the drive belts. Roller spacing is 3″. Rollers and frames are steel with a galvanized finish, unless otherwise stated. Rollers have steel ball bearings and 7/16″ hex axles. Frames are 5 1/2″ high and have coupling plates to connect sections. Stands bolt to the conveyor frames and adjust the overall conveyor height from 36″ to 48″. For replacement rollers, see page 1308. *Note:* Capacities are based on an evenly distributed load.

Drive sections drive up to 60 ft. of conveyor on either side and can be hardwired for material flow in either direction. They have a 1/2-hp, three-phase, totally-enclosed fan-cooled motor that operates on 230/460 volts AC.

Extensions connect to drive sections to lengthen the conveyor.

90° curves have tapered rollers that keep packages centered. Rollers are zinc-plated steel.

Also Available: Replacement rollers and stands. Please ask for 5898K777 and specify roller or stand and conveyor part number. For other replacement parts, please ask for 5898K888 and specify part required.

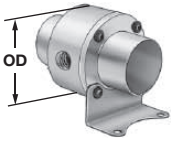
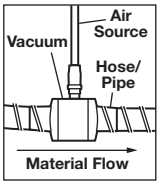
Air-Powered Vacuum Conveyors



Vacuum for Hose Shown with Mounting Bracket



Attach hose, duct hose, or pipe to these vacuums to create a powerful inline conveyor that moves plastic pellets, scrap trim, sawdust, and other bulk solids. A small amount of compressed air at the inlet produces a vacuum at one end and a high-output flow at the other. Vacuums have no moving parts and require minimal maintenance. A complete conveying system requires a vacuum, hose or pipe, filter, regulator (to control flow), and air hose. For filters and regulators, the max. scfm rating at 80 psi should be equal to or greater than the air consumption of the vacuum. See pgs. 297-299 for hose, pgs. 253-261 for duct hose, pg. 48 for pipe, pg. 1026 for filters and regulators, and pg. 264-266 for air hose.

Vacuums for NPT-threaded pipe have male threads on the intake and exhaust ends.

Aluminum vacuums are lightweight and corrosion resistant. ***Steel vacuums*** are more durable than aluminum so they're better for larger, more abrasive objects such as steel shot and glass beads.

Mounting brackets are made of stainless steel. Mounting fasteners not included.

Also Available: Stainless steel vacuums. Please ask for 2379T888 and specify hose/pipe size.

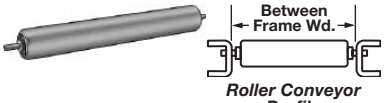
Small Diameter Conveyor Rollers



Roller Conveyor Profile

Rollers have spring-loaded axles and steel ball bearings unless otherwise stated.

Galvanized steel rollers are strong and provide some corrosion resistance.

Aluminum rollers are lightweight and corrosion resistant.

PVC rollers are lightweight and nonmarking. Rollers have plastic-encased stainless steel bearings. Temp. range is 30° to 150° F. Color is gray.

Stainless steel rollers provide excellent corrosion resistance for washdown applications. Rollers have plastic-encased stainless steel bearings. Temp. range is 30° to 150° F.

Steel Rollers with 7/16″ Hex Axles

General Purpose—Rollers are made of 16-ga. steel with a galvanized finish and have zinc-plated steel ball bearings. Temperature range is –20° to 350° F.

Heavy Duty—These durable rollers are made of 12-ga. steel and have heavy duty zinc-plated steel ball bearings. Temperature range is –20° to 250° F.

Quiet-Roll—Rollers have quiet-running, maintenance-free precision steel ball bearings with a plastic housing. Rollers are made of 16-ga. steel with a galvanized finish. Temperature range is –20° to 165° F.

Quiet-Roll with Tapered Axle—Tapered axles fit securely in worn axle holes. Rollers have quiet-running, maintenance-free precision steel ball bearings with a static-control plastic housing. Rollers are made of 16-ga. steel with a galvanized finish. Temperature range is –4° to 212° F.

Washdown—Stainless steel rollers and axles offer excellent corrosion resistance. Rollers have stainless steel ball bearings with a plastic housing. Temperature range is 10° to 150° F.

PVC, Polyethylene-Covered, and Polyurethane-Covered Rollers with 7/16″ Hex Axles

Corrosion-Resistant PVC—Choose these nonmarring rollers for light duty applications. Rollers are made of 0.11″ thick PVC and have plastic-encased steel ball bearings. Temp. range is 14° to 176° F. Color is gray.

Nonstick Polyethylene Covered—Rollers are made of 16-ga. steel with a nonremovable cover. Rollers have quiet-running, maintenance-free precision steel ball bearings in a plastic housing. Temperature range is 10° to 150° F. Color is white.

Abrasion-Resistant Polyurethane Covered—The nonremovable polyurethane cover gives these steel rollers extra abrasion resistance. Rollers are made of 16-ga. steel and have quiet-running, maintenance-free precision steel ball bearings in a plastic housing. Temp. range is 10° to 150° F. Color is black.

Tapered Rollers for Curved Conveyors

Keep packages on track in curved sections of 1.9″ dia. roller conveyors. Rollers taper from approximately 2 1/2″ diameter on the outside to 1 5/8″ on the inside end so packages maintain their orientation through the curve. Rollers are made of 14-ga. steel with a galvanized finish. They have 7/16″ hex spring-loaded axles and steel ball bearings.

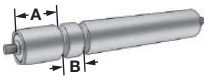
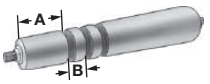
Grooved Rollers for Belt-Driven Conveyors

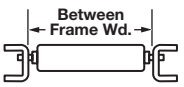
Single Groove



Double Groove



Tapered Triple Groove



Roller Conveyor Profile

Rollers have grooves to accommodate 3/16″ diameter belts in line-shaft conveyors. (See page 1095 for urethane belts.) All rollers have 7/16″ hex spring-loaded axles and steel ball bearings. Rollers are steel with a galvanized finish.

Single-groove and ***double-groove*** rollers are 1.9″ diameter and made of 16-ga. steel. *Double-groove* rollers can also be used with powered conveyor rollers.

Tapered triple-groove rollers improve package tracking in curved sections of 1.9″ dia. roller conveyors. Rollers taper from approximately 2 1/2″ diameter on the outside to 1 5/8″ on the inside end. Rollers are made of 14-ga. steel.

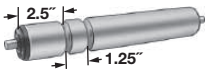
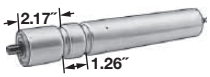
▲Made of 0.15″ thick steel. ●Roller is plain steel.

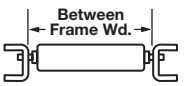
Powered 1.9″ Diameter Conveyor Rollers



24V DC



120V AC and 230V AC



Roller Conveyor Profile

Also known as drive rollers, these rollers connect to other double-groove rollers with 3/16″ diameter belts to power gravity conveyors. (See page 1095 for urethane belts.) All rollers have 7/16″ hex spring-loaded axles and quiet-running precision steel ball bearings that are shielded to keep out dirt and debris.

24-volt DC rollers drive up to nine rollers and have a continuous duty cycle with up to 30 starts and stops per minute. They are made of 16-ga. steel with a galvanized finish. All have a brushless motor and an integrated current-limiting circuit that protects the motor. Temperature range is 32° to 104° F.

120-volt AC and ***230-volt AC*** rollers drive up to five rollers and have a duty cycle of three seconds on, two seconds off. They are made of 1/16″ thick steel with a zinc-plated finish and include a terminal mounting bracket. Temp. range is 14° to 104° F. *120-volt AC* rollers have a single-phase motor. *230-volt AC* rollers have a three-phase motor.

To Order: Please specify voltage and speed.

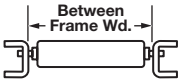
Large Diameter Conveyor Rollers



Roller Conveyor Profile

Keep things moving with roller diameters beyond the typical 1.9″.

Aluminum rollers are lightweight and corrosion resistant. They have spring-loaded axles and steel ball bearings.

Steel rollers are stronger than aluminum. They have steel ball bearings and spring-loaded axles, except 3 1/2″ diameter rollers, which include cotter pins to attach axles to the conveyor frame. 2 9/16″ and 3 1/2″ diameter rollers have sealed bearings to keep out dirt and moisture for longer life.

Stainless steel rollers offer excellent corrosion resistance. They have spring-loaded axles and sealed stainless steel ball bearings to keep out dirt and moisture for longer life.

Powered Large Diameter Conveyor Rollers

Add power to your 2½″ diameter roller gravity conveyor or create a custom powered conveyor. Rollers are made of 3⁄32″ thick steel with a nickel-plated finish. They have 11⁄16″ hex spring-loaded axles and quiet-running precision steel ball bearings. Rollers can be hardwired to operate in either direction. Duty cycle is 70% for a 40-minute period. Temperature range is 14° to 130° F. *120-volt AC* motors are single phase. *220-volt AC* motors are three phase.

To Order: Please specify voltage and speed.

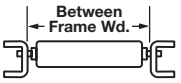
Rollers for Chain-Driven Conveyors



Roller Conveyor Profile

Replace worn rollers on chain-driven conveyors. Rollers are made of steel and have spring-loaded axles. Each roller has two welded sprockets for connecting to ANSI No. 40 roller chain. Sprockets are spaced 1⅛″ center to center; clearance between the end of the roller bearing and the first sprocket is 11⁄16″. For replacement chain, see page 1078.

Roller Dia.	For Between Frame Wd.	Hex Axle Size	Cap., lbs.	Number of Teeth per Sprocket		
1.9″	31″	7⁄16″	280	18	5921K11	$49.10

2½″	55″	11⁄16″	505	22	5921K16	88.98

Speed Reducers for Roller Conveyors

Also known as pallet brakes, these mount underneath the rollers on your gravity conveyor and create friction on the rollers to control the conveyor's speed. Speed reducers have an internal brake that gradually engages as the speed of the rollers increases.

Use with 1⅜″, 1.9″, and 2½″ dia. roller conveyors with 2″-4″ roller spacing. Units are steel with a rubber-coated plastic wheel and include hardware for attachment to the conveyor frame. Overall size is 7⅜″ Lg. × 4″ Wd. × 4¾″ Ht. For best results, the spacing of the reducers should be equal to the length of the material you're conveying.

Capacity Range, lbs.		
25-500	8424T12	$87.50
175-1,800	8424T13	87.50
500-2,500	8424T14	87.50

Bearings for Conveyor Rollers

Press fit bearings into tubing or pipe to replace worn or damaged bearings or make your own rollers. For galvanized pipe, see pg. 61. For stainless steel pipe, see pgs. 6-7. For PVC pipe, see pgs. 84 and 90.

Precision ball bearings have quiet, maintenance-free balls that are shielded to keep out contaminants for longer life.

Zinc-Plated Steel—Temperature range is –10° to 225° F. Bearings have steel balls.

Acetal—Temperature range is –40° to 180° F. *Sleeve bearings* ride directly on the axle and have no moving parts to wear out. *Ball bearings with hex axle* have stainless steel balls.

Polypropylene—Temp range is –10° to 140° F. Bearings have stainless steel balls, except *precision ball bearings*, which have steel balls.

Stainless Steel—Temp. range is –10° to 300° F. Bearings have stainless steel balls and offer excellent corrosion resistance.

Nylon—Temp. range is –20° to 210° F. Bearings have steel balls.

Shaft-Mount Conveyor Rollers

Two Rollers Shown with Shaft

Slip these rollers onto a shaft (not included) for a better grip at high speeds and on lightweight products such as paper. Rollers are made of polyurethane, which is nonmarking and resists abrasion. Temp. range is –40° to 170° F. Color is yellow for 30A durometer, blue for 60A durometer, and red for 90A durometer. A higher durometer means increased hardness, less compression, and less friction.

To Order: Please specify durometer.

For Shaft OD	OD	Wd.	Available Durometers

Conveyor Roller Brackets

Surface-Mount Bracket

Frame-Repair Bracket

Surface-mount brackets let you create custom conveyors, support stands, or package stops. Brackets are steel with a galvanized finish and have a 13/32" Wd. × 1" Lg. mounting slot (fasteners not included). *Note:* Two brackets are required for each roller.

Frame-repair bracket mounts to your conveyor frame to recondition a worn hex axle hole or to convert a round axle hole to a hex axle hole. Bracket is polypropylene and includes fasteners for mounting to your axle and frame.

For Axle Size	(A)		
Surface-Mount Brackets

Frame-Repair Brackets			
7/16" Hex	1 3/8"	4960T14	28.48

Cut-to-Width Conveyor Roller Covers

Reduce noise, absorb impact and shock, and extend the life of your rollers with these nonmarking covers. ***Polyurethane*** has a high-friction surface for high speeds and inclines. ***PVC*** is for use in corrosive environments.

Slide-on covers are 1/8" thick. For easier installation, use lubricant and an air nozzle (sold separately). Lubricant is water based and loses its lubrication properties upon drying to ensure covers retain a snug fit. Air nozzles deliver a cushion of air that makes it easier to slide the cover onto a roller. Air inlet is 1/4" NPT female.

Heat-shrink covers are 0.05" thick and conform to the shape of your roller when heated. Minimum shrink temperature is 212° F. *White PVC* covers are FDA compliant. *2 1/2" tapered* cover fits rollers that taper from 2 1/2" to 1 1/2" dia.

Skate Wheels

Steel wheels are stronger than aluminum and have steel ball bearings.

Aluminum wheels are lightweight and corrosion resistant. Wheels have steel ball bearings.

Rubber on steel wheel consists of 1/16" thick rubber on a steel core with steel ball bearings. Rubber has a durometer of 50D.

Polyurethane on steel wheels consist of 5/32" thick polyurethane on a steel core and with steel ball bearings. *Orange* polyurethane has a durometer of 75A. *Yellow* polyurethane has a durometer of 85A.

Nylon wheels are nonmarking, corrosion resistant, and quieter than metal. *Style 3* has a nylon hub with an abrasion-resistant acetal wheel and steel ball bearings. *Style 4* has a plain bore (no bearings).

ABS wheels are nonmarking and quieter than metal. They resist corrosion and acids. *Styles 4* and *5* have a plain bore (no bearings). *Style 5* has a 2 3/4" Dia. × 1/2" Wd. flange on one side. *Style 6* has acetal roller bearings.

Glass-filled nylon wheel is stronger than nylon and is a good choice for washdowns and harsh environments. Wheel has steel ball bearings.

Polycarbonate wheels have high capacities and good impact resistance. *225-* and *580-lb. cap.* wheels have a plain bore (no bearings). *320-lb. cap.* wheels have steel ball bearings.

Multidirectional acetal wheels have rollers that rotate around the wheel core to allow movement of material in any direction. Wheels have a plain bore (no bearings).

About Ball Transfers

Ball Up

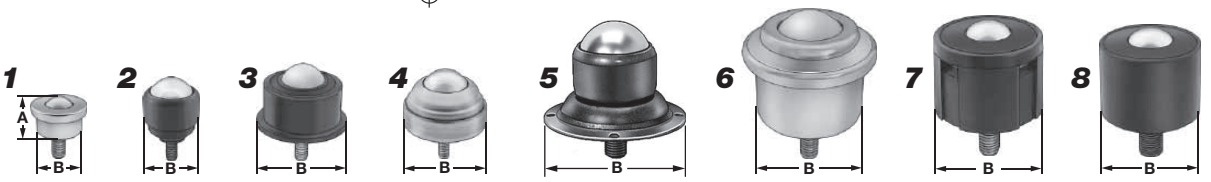
Ball Down

Angle

Ball transfers provide unlimited change of direction and easy movement of loads. Use transfers with the ball up in diverter tables, conveyor lines, and transfer tables. Several transfers can also be used ball down as casters or at an angle to form stock stands for pipe and tubing.

Steel transfers are durable. ***Nylon*** transfers are nonmarking. ***Stainless steel*** transfers offer the most corrosion resistance.

Stud-Mount Ball Transfers



Transfers can be used ball up, ball down, or at an angle, unless noted. Temperature range for nylon balls and housings is 32° to 212°F.

◆Not for use in angled applications. ●Not for use in ball-down or angled applications.

Miniature Stud-Mount Ball Transfers

Move small parts in measuring and automation applications. Mount transfers with the ball up. Ball is stainless steel and housing is aluminum.

Ball Dia.	Cap., lbs.	(A)	(B)	Thread Size	Stud Lg.		
3/16"	20	1/4"	5/16"	M2	3/32"	2440T31	$45.71

5/16"	55	1/2"	19/32"	M4	5/16"	2440T33	58.68

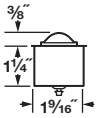
Pop-Up Ball Transfers and Pads

Ball transfer and pad rise when you supply air and retract into the housing when air supply ceases. Place units in workstations or between conveyor rollers to move or hold material. Housing is galvanized steel with a brass barbed fitting on the bottom for 1/16" ID tubing. Both operate on 50 psi.

Ball transfer lets you move and divert material without lifting. Ball is steel.

Pad has a polyurethane surface that, when raised, holds a load in place. Temp. range is 32° to 100°F.

Ball Transfer



Pad

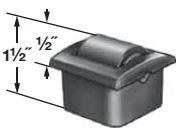
	Cap., lbs.		
Ball Transfer	15	57855K4	$31.17
Pad	30	57855K8	36.28

Press-Fit Wheels

Create a low-profile conveying surface. Wheels have a black nylon housing. Temperature range is –50° to 120°F.

Nylon wheel is black and has a PTFE sleeve-style bearing.

Steel wheel is zinc plated and has a precision ball bearing.



Wheel Material	Cap., lbs.	Wheel Dia.	For Hole Size		
Nylon	50	1 3/16"	1 3/4" Sq.	2303T11	$12.60
Steel	400	1 5/16"	1 3/4" Sq.	2303T32	15.75

Nonmarring Cushion Ball Transfers

A large-diameter ball handles delicate and polished surfaces. Covers on the bearing and mounting stud keep out dust and debris. Stud is steel with M14 threads and has zinc-plated steel locknuts. Temp. range is –4° to 140°F.

Rubber balls are black. ***Polyurethane*** balls are red.

Ball Dia.	Cap., lbs.	Ht.	*Rubber*		*Polyurethane*	
1 3/8"	30	1 13/16"	2411T111	$16.48	2411T211	$33.37
1 31/32"	40	2 17/32"	2411T121	21.28	2411T221	39.67

Flange-Mount Ball Transfers

Transfers can be used ball up, ball down, or at an angle, unless noted. Temp. range for nylon and acetal balls and housings is 32° to 195°F.

Screw Conveyor Components

Add on to your existing screw conveyor or keep it running like new. Components are made of steel unless noted.

Screws are designed for right-hand operation. Screws with a greater edge thickness offer longer service life for abrasive materials.

Trough covers include 10 clamps and a rubber seal.

Discharge spouts can be welded to a cutout in the trough.

Coupling shafts connect two screws together. ***End shafts*** support the end conveyor section. ***Bolts*** connect shafts to the screw.

End-shaft seals prevent material contamination and discharge.

End-shaft bearings support the end of the shaft and help the screw rotate.

Bearing hangers mount inside the trough (bearing sold separately). ***Hardwood*** bearings are oil impregnated and are commonly used in agricultural applications. ***UHMW*** bearings are FDA and USDA compliant and work well with chemicals and wet environments. ***Iron*** bearings are oil impregnated and offer longer life for abrasive materials. ***Bronze*** bearings are oil impregnated and handle temperatures up to 850° F.

Also Available: Stainless steel components. Please ask for 5866K88 and specify screw and shaft diameters and components desired.

Conveyor Belting

Food-grade belting is FDA compliant for food handling when used with stainless steel lacing.

Belting ***for slider-bed conveyors*** has a low-friction surface on the bottom that smoothly glides along the bed of the conveyor. Belting ***for roller-bed conveyors*** has a tough cover on the bottom to grip rollers.

Also Available: Belts with lacing installed and "endless" belts (continuous loops without lacing). We can also customize your belt with cleats, pegs, and punched holes. When ordering, please specify the part number of the belting you need and how you want it customized.

Smooth Belting for Flat Conveyors

Standard

General purpose PVC resists impact and tears. Belting is one ply with a cover on the top. Maximum temperature is 180° F.

Cut-resistant PVC is two ply for extra strength. Belting has a cover on the top. Maximum temperature is 158° F.

Slip-top nylon is good for accumulation applications where products need to remain in a fixed position while the belt is moving. Belting is four ply with a hard cover on the top. Maximum temperature is 250° F.

Oil-resistant neoprene not only has superior resistance to oils but also resists shrinking. It has a low-friction surface on the top. Maximum temperature is 250° F. *0.06″ thick* is three ply. *0.11″ thick* is five ply.

Food-grade general purpose nitrile, also known as Hycar and Buna-N, is the most popular food-grade belting. It resists animal fats and oils. Belting is two ply with a cover on the top. Max. temp. is 250° F.

Food-grade oil-resistant vinyl-nitrile is nonstaining and resists fats and grease. Impervious to hot water. Belting is two ply with a glossy cover on the top. Maximum temperature is 180° F.

Food-grade abrasion-resistant urethane is more durable than nitrile. It's nonstaining and nonsticking. Belting is two ply with a glossy cover on the top. Maximum temperature is 180° F.

Heavy duty abrasion-resistant SBR (styrene butadiene rubber) is excellent for abrasive and high-impact applications including conveying stone, sand, and glass particles. Belting is two ply with a tough cover on the top. Maximum temperature is 200° F.

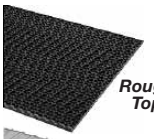
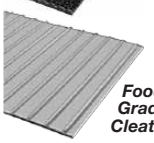
Textured Belting for Incline Conveyors



Rough Top



Food Grade Cleated

The surface keeps your material from slipping and rolling when traveling on inclines and declines. Maximum temperature is 250° F, except general purpose PVC belting, which has a maximum temperature of 158° F.

Rough-top belting has a deeply textured surface to grip packages and cartons. *Note:* The top surface of the belt ends should be removed (by skiving or grinding) before installing lacing. Recommended lacing is based on the thickness of the belt after removing the top surface. For Surface Removal Tool, see 6202T48 on page 1317.

General purpose PVC resists impact and tears. Belting is two ply with a cover on the top.

Extra-grip SBR (styrene butadiene rubber) has good impact resistance and an excellent grip. Belting has a cover on the top. *0.25″ thick* belting is two ply. *0.27″ thick* belting is three ply.

Oil-resistant neoprene has a good grip along with superior oil resistance. Belting is three ply with a cover on the top.

Abrasion-resistant nitrile has a hard textured surface that resists punctures and abrasion. Belting is three ply with a cover on the top.

Food-grade cleated has 1/8″ high cleats every inch. Also known as Hycar and Buna-N, it resists animal fats and oils. Belting is three ply with a cover on the top.

Bolt-On Cleats for Conveyor Belts

Convert any smooth conveyor belt into a belt for inclines. Cut cleats to the length you need with a utility knife.

Abrasion-Resistant EPDM— More durable than nitrile, EPDM also has better resistance to acids and weather. Cleats attach to belts with the included bolts and nuts. Maximum temperature is 300°F.

Food-Grade Oil-Resistant Nitrile— The smooth surface is easy to clean and prevents build up of debris. Nitrile resists acids, abrasion, and weather. Cleats have integral threaded inserts for a secure connection and attach to belts with the included stainless steel screws and washers. Maximum temperature is 240°F. FDA compliant.

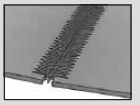
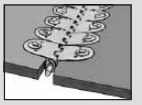
Hammer-On Alligator



Press-On Clipper

Staple-On Alligator



Bolt-On

Lacing creates a strong, reliable connection on belting ends that provides more convenient belt installation than "endless" (continuous-loop) belts.

Hammer-On Alligator— Lacing is low profile and requires no special tools for installation.

Press-On Clipper— A lacer clinches these low-profile hooks onto the belt for reduced installation time and consistent connections.

Staple-On Alligator— Staples secure the lacing plates to the conveyor belt for a strong, impact-resistant connection.

Bolt-On— The heaviest duty style we offer, lacing consists of plates compressed into the belt by bolts and nuts.

Hammer-On Alligator Lacing for Conveyor Belts

Since the only tool you'll need to install this lacing is a hammer, it's perfect for repairs and areas where lacing machines would be difficult to use. The low-profile, one-piece design runs smoothly over idler rollers without catching on conveyed products. Lacing can be cut to size with wire-cutting pliers. Each box includes lacing, connecting pins, and an installation gauge pin with clips, except No. 00 lacing does not require clips.

Type 316 stainless steel lacing provides better corrosion resistance than galvanized steel and is nonmagnetic.

Also Available: Extra connecting pins and installation clips. For connecting pins, please ask for 6110K888 and specify lacing number and length. For clips, please ask for 6110K777 and specify lacing number.

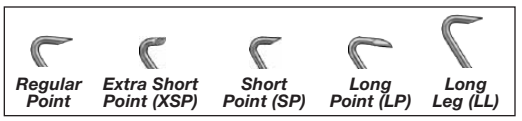
Press-On Clipper Lacing for Conveyor Belts

Conveyor Belt Lacing

Standard

Unibar



Clipper lacing is a low-profile connection that is installed with a lacer for reduced installation time and consistent connections (lacer sold separately). Lacing consists of hooks in a staggered pattern. Long leg (LL) hooks hold more belt fibers than regular hooks, which prevents the lacing from pulling out once installed.

Note: Two laces are required for each joint.

Stainless steel lacing provides better corrosion resistance than steel. Lacing is magnetic, unless noted.

Standard— Each hook is secured to a cardboard sheet. Use on flat and troughed conveyors.

Unibar— More durable and easier to install than standard lacing, each hook is welded to a metal bar. Use on flat conveyors.

■ Nonmagnetic. ●Connecting pins sold separately.

Connecting Pins

Insert a pin into the lacing and lock it in place by bending the ends at a 90° angle. Pins have a nylon coating. *Stainless steel* is nonmagnetic.

♦Works with all leg and point styles for a given series number. ♥For lengths of 100 ft. or more, price is approximately 10% less.

Lacers

A

B

To lace belts wider than the working width, repeat the operation.

Style A lacers mount in your vise. ***Style B*** lacers are wider for more efficient installation.

Holding strips are required for Style B to load the lacing. To Order: Please specify lacing series number.

♣Works with both Standard and Unibar lacing in all leg and point styles for a given series number.

Staple-On Alligator Lacing for Conveyor Belts

Lacing

Not only is this lacing strong and impact resistant, it's easier to install than bolt-on lacing. An installation tool (required; sold separately) guides staples as they are driven into place. Each box contains lacing and nylon-coated connecting pins for four connections.

Stainless steel lacing provides better corrosion resistance than steel and is nonmagnetic.

6" Wide Installation Tool

Bolt-On Lacing for Heavy Duty Conveyor Belts

Commonly used in mining conveyors, this galvanized steel lacing repairs and extends thick, heavy belts. Laces include fasteners and a nylon-coated connecting pin for one connection.

Installation tools are required for proper installation. Punch holes in the belt using the *power punch bit*, then fasten bolts with the *power wrench bit*. *Quick-change adapter* lets you use the power bits with a 1/2" impact wrench. ***Templates*** serve as guides when punching holes and cutting belt ends.

Also Available: Stainless steel lacing and power wrench bit for stainless steel fasteners. For lacing, please ask for 6143K888 and specify belt width. For power wrench bit, please ask for 6143K94.

Pulleys for Conveyor Belts

Replace worn and damaged pulleys or create new conveyors. Pulleys are steel and have a keyway with two set screws at each end, unless noted. For keyed shafts, see pages 1130-1131. Also known as crowned pulleys, 4" to 8" diameter pulleys have tapered ends to improve belt tracking.

To Order: Please specify bore size: 1/2" bore with 1/8"×1/16" keyway (unless noted), 5/8" or 3/4" bore with 3/16"×3/32" keyway, or 1" bore with 1/4"×1/8" keyway.

Also Available: Pulleys with 1/4" thick rubber coating (lagging). Please ask for 5706K888 and specify pulley diameter (without coating), pulley width, and bore size.

Also Available: Stainless steel pulleys. Please ask for 5706K777 and specify pulley diameter, pulley width, and bore size.

Surface Removal Tool

Conveyor Belt Tensioners and Bearings

Tensioner and Bearing

Extend or retract your conveyor belt pulley to adjust the tension on the belt. Tensioners mount to the sides of the conveyor and attach to bearings (sold separately) that hold the pulley shaft. *Note:* Two tensioners and two bearings are required.

Tensioners are steel with a gray painted finish and have a cadmium-plated steel adjustment rod and nut. Mounting hole diameter is 9/16″ (fasteners not included).

Bearings are cast iron and have a locking collar with two set screws. Temperature range is –20° to 200° F.

Also Available: Stainless steel tensioners and stainless steel bearings with a plastic housing. For tensioners, please ask for 6029K888 and specify maximum adjustment: 3″, 6″, 9″, or 12″. For bearings, please ask for 6029K777 and specify shaft diameter: 5/8″, 3/4″, 7/8″, or 1″.

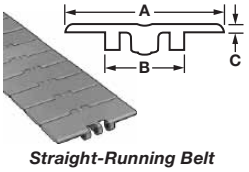
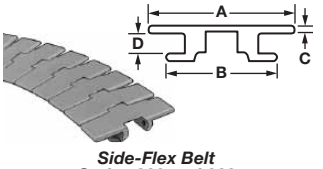
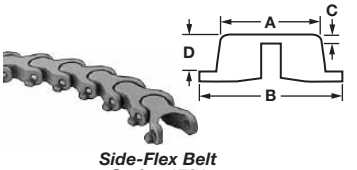
Sprocket-Driven Conveyor Belts



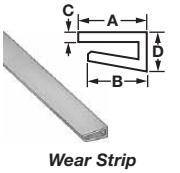
Straight-Running Belt



Side-Flex Belt Series 880 and 882



Side-Flex Belt Series 1701



Wear Strip

An excellent choice for food handling, packaging, and bottling, belts consist of links connected by stainless steel pins. Also known as conveyor chain. Links are FDA-compliant brown acetal and temperature range is –40° to 194° F, unless otherwise stated.

Straight-running belts have overlapping links so there are no gaps. *High-temperature* belts are made of stainless steel, which is nonmagnetic and corrosion resistant. Temperature range is –94° to 806° F.

Side-flex belts have tabs on the bottom that keep the belt from lifting off the track when traveling through curved sections of conveyor.

Wear strips attach to conveyor frames up to 1/8″ thick to reduce friction and abrasion on your belt. Made of white UHMW polyethylene.

Also Available: Acetal rivets to attach wear strips to your frame. Please ask for 6369K888 and specify 3/4″, 1″, or 1½″ rivet length.

Sprockets and Idler Wheels for Sprocket-Driven Conveyor Belts

Drive sprockets and idler wheels keep your belt moving smoothly. For quick installation, sprockets and wheels consist of two halves connected by corrosion-resistant fasteners, unless noted. Made of polyamide. Temp. range is 32° to 194° F.

DRIVE SPROCKETS | IDLER WHEELS

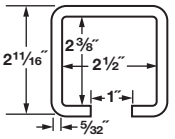
Overhead Enclosed-Track Conveyor Components

The enclosed track protects trolleys and chain from contamination and damage. Components fit track with an inside width of 2½″.

Track

Straight

90° Horizontal Curve



Steel track provides the runway for trolleys, carriers, and chain in manual and powered systems. Install at least one hanger bracket (sold separately) every 5 feet. Track has a blue painted finish.

Straight—10 ft. Length		5927K11	$119.64
90° Horizontal Curve—2 ft. Radius		5927K12	168.75
90° Horizontal Curve—3 ft. Radius		5927K13	216.96
90° Horizontal Curve—4 ft. Radius		5927K14	265.18

Brackets

Brackets are steel and have a ½″ dia. hole in the top for hanging from threaded rod.

Hanger bracket holds track in place with nuts (not included) on threaded rod.

Joint bracket connects two sections of track when tightened with the included bolts.

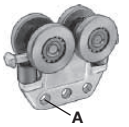
Hanger Bracket

Joint Bracket

	Ht.		
Hanger Bracket	4½″	5927K19	$29.70
Joint Bracket	4 7/16″	5927K18	128.48

Trolleys for Manual Conveyors

Sturdy cast iron construction and ball bearing wheels provide smooth operation. Wheels and ball bearings are steel. Distance from the bottom of the track to the center of (A) is 1½″.



Ht.	Wd.	(A)	Cap., lbs.		
4 9/16″	6″	17/32″	250	5927K42	$56.25

Carriers and Chain for Powered Conveyors

Carrier Shown Open

Carrier Shown Closed

Chain

Carrier attaches loads to the chain with a scissor-like action and pivot as the conveyor makes elevation changes. Maximum incline is 45°. Use where swinging loads are permitted.

Chain is a series of smooth-rolling, alternating vertical and horizontal wheels that carry loads along the track. Steel pins connect the wheels and detach for quick installation and replacement. Vertical wheel axles spaced every 8″ serve as attachment points for carriers. *Note:* Capacity listed is per attachment point.

	Cap., lbs.		
Carrier—4¼″ Ht. × 1″ Wd.	125	5927K27	$3.60
Chain—20 ft. Lg.	125	5927K34	654.91

Overhead I-Beam Conveyor Components

I-beam conveyors are built to handle heavier loads than enclosed-track conveyors and are easy to install and expand.

Track

I-beam track provides the runway for trolleys in manual and powered systems. Made of steel with a gray primer finish. *Note:* Not designed for building structural support.

Track Ht.	Flange Wd.	Track Thick.	Lg., ft.	Weight, lbs./ft.		
3″	2.33″	0.17″	10	5.7	5920K2	$145.69
4″	2.66″	0.19″	10	7.7	5920K3	146.74

Trolleys for Manual Conveyors

Prevent excess wear on your track and trolley—only the wheels of these hand-push trolleys come in contact with the I-beam. Trolleys can be taken apart for installation anywhere along the I-beam. Wheels and ball bearings are steel; brackets are cast iron.

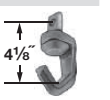
3″	X348	10	5920K21	$158.65
4″	X458	10	5920K22	170.67

Hooks for Powered Conveyors

Hooks allow items to rotate 90° while suspended. They attach to trolleys with a ½″ bolt and nut (not included). Made of malleable iron.



5920K31 ..... $16.20

Easy-Cut Strip Brushes and Holders

Cut these flexible brushes and holders to fit your conveyor. Brushes have fused bristles that won't fall out when the backing is cut. All can be cut to size with scissors.

Brushes

Backing and bristles are black nylon. Maximum temperature is 250°F.
To Order: Please specify length.

O'all Ht.	Bristle Dia.	Available Lengths, ft.		Per Ft.
1″	0.010″	3, 5, 10, 25, 50, 100	7900T1	$2.28

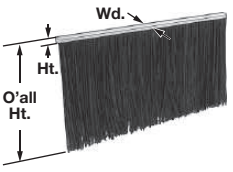
Tight-Seal Strip Brushes



0.006″ Dia. Bristles (Actual Size)

0.014″ Dia. Bristles (Actual Size)

0.045″ Dia. Bristles (Actual Size)

Brushes have dense bristles that can dust, stop, and separate items on a conveyor. They also keep heat, sprayed liquids, and chips contained. Bristles are held in place by a continuous metal backing and a binding wire. Brushes can be cut to size with wire-cutting pliers (see page 2743). The larger the bristle diameter, the stiffer the bristles. For strip brush holders, see page 1321.

General Purpose Nylon Bristles— Bristles are abrasion resistant. Color is black. Maximum temperature is 225°F.

Static-Control Nylon Bristles— Nylon dissipates static to keep it from building up. Color is black. Maximum temperature is 200°F.

Detectable Polyester Bristles— Bristles contain a compound that metal detectors and x-ray equipment can detect. Color is gray. Maximum temperature is 200°F.

Food-Grade Polyester— Made of FDA-compliant polyester, brushes are good for food and beverage conveying. Color is white. Maximum temperature is 200°F.

High-Temperature PTFE Bristles— Choose these brushes for high-temperature and nonstick applications. Color is off-white. Maximum temperature is 500°F.

Ultra-Soft Horsehair Bristles— Excellent for picking up dust and fine powders in finishing and cleaning applications. Color is brown. Maximum temperature is 300°F.

Soft Brass Bristles— Bristles won't scratch other metals. Brass is conductive to prevent static buildup. Maximum temperature is 500°F.

Corrosion-Resistant Stainless Steel Bristles— Use for corrosive and high-temperature environments. Stiffer than brass. Maximum temperature is 800°F.

Steel backing has a galvanized finish. *Stainless steel backing* resists corrosion.
To Order: Please specify length in 1-ft. increments. Maximum continuous length is 8 ft. except for brushes with PTFE bristles, which have a maximum continuous length of 6 ft.

Tight-Seal Strip Brush Holders

Slide a strip brush into one of these holders and position it on your conveyor. Use with the Tight-Seal Strip Brushes shown on the previous page. Holders have a channel for one strip brush, except *Style 2*, which holds two brushes. Cut holders to size with a hacksaw. They can be drilled for mounting, except *Style 8,* which has a top channel that grips onto surfaces up to 1/16" thick.

Direct-Mount Strip Brushes

Brushes have bristles stapled into a PVC backing. The backing can be drilled for mounting, except *Style 11*, which has a top channel that grips onto surfaces up to 1/16" thick. Use brushes to clean conveyor belts as well as to contain dust, sprayed liquids, heat, and chips. Bristles are black. The larger the bristle diameter, the stiffer the bristles.

Flexible backing can be cut to size with a utility knife. *Rigid backing* can be cut to size with a hacksaw.

General Purpose Nylon Bristles—Bristles are abrasion resistant. Maximum temperature is 150°F.

Ultra-Soft Horsehair Bristles—Excellent for picking up dust and fine powders in finishing and cleaning applications. Maximum temperature is 300°F.

Cylindrical Conveyor Brushes

With polypropylene bristles in a tight spiral pattern, these brushes are effective for cleaning conveyor belts and chain. Bristles are black. The larger the bristle diameter, the stiffer the bristles.

Bristles are mounted on a steel tube and include set screws for securing to a 1" diameter shaft (shaft not included). Maximum temperature is 200°F.

Adjustable Conveyor Brushes

Adjust the angle to fit 11" to 29" wide conveyors using the mounting kit (sold separately). Use brushes for light cleaning and product positioning. The larger the bristle diameter, the stiffer the bristles. Max. temp. is 225°F.

Mounting kit includes a 1/2" Dia.×36" Lg. shaft, mounting brackets, and hardware.

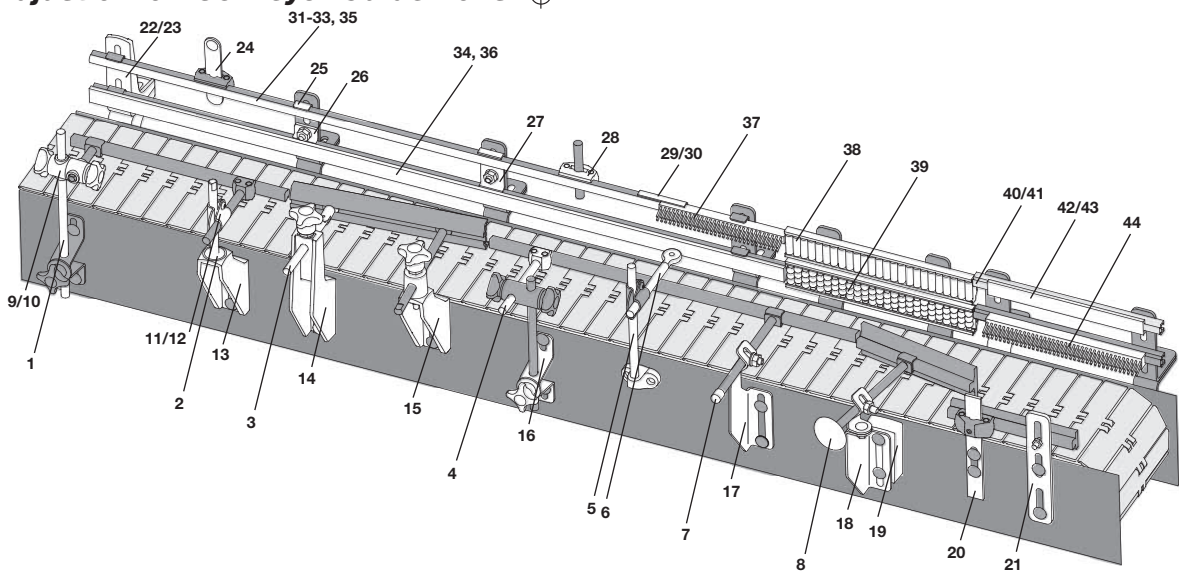
Adjust-a-Rail Conveyor Guide Rails



Mounting Rods and Accessories

Use rods with mounting rod brackets, connectors, and clamps to support and position guide rails and accessories. All rods are ½″ diameter and made of stainless steel.

(1) Mounting rods have black plastic end caps.

(2&3) Threaded mounting rods accept a 5⁄16″-18 bolt. *(3) Pivoting threaded mounting rods* make angle-mounting easy.

(4) Mounting rod with clamp includes a plastic clamp with two bolts for a tight grip on your guide rail.

(5) T-style mounting rod includes a plastic bracket for mounting to your conveyor. Mounting holes are ¼″ dia. (fasteners not included).

(6) Rod with accessory/sensor holder has a plastic holder with a ¼″ dia. hole for attachments.

(7&8) End caps cover mounting rod ends.

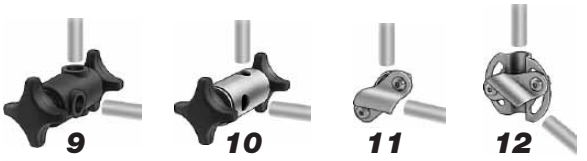
Mounting Rod Connectors



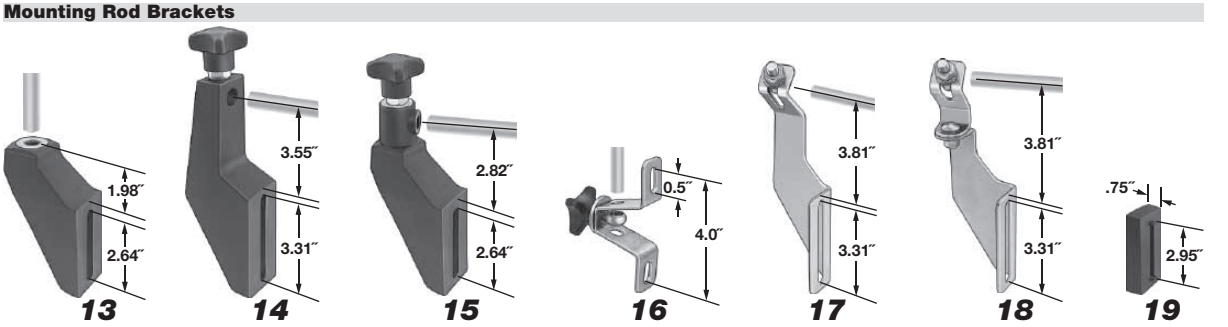
All connectors fit ½″ diameter rods.

(9&10) Connectors have plastic knobs for easy adjustment.

(12) Connector rotates for mounting versatility.

9	90° Angle—Plastic	9268K85	$21.48
10	90° Angle—Stainless Steel	9268K23	49.30
11	90° Angle—Stainless Steel	9268K146	11.17
12	Adjustable Angle—Stainless Steel	9268K145	16.72

Mounting Rod Brackets



Brackets accommodate ½″ diameter rods. Mounting slots are 0.41″ wide (fasteners not included). *Plastic brackets* and *spacer* are black. Brackets *with swivel head* offer added versatility for angled mounting.

(14-16) Brackets have a plastic knob for easy adjustment.

(19) Bracket spacer increases the distance between the bracket and the conveyor frame. Multiple spacers can be used. Spacer is not for use with Style 16.

(Continued on following page)

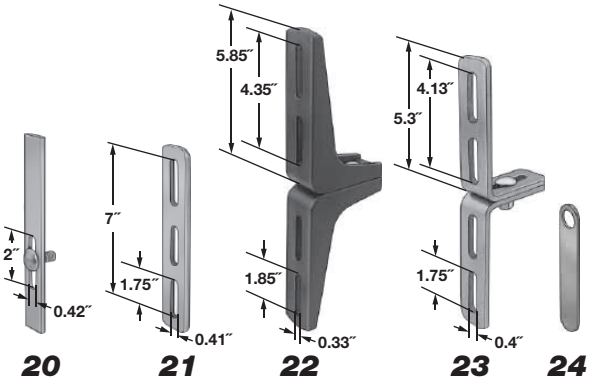
Adjust-a-Rail Conveyor Guide Rails *(Continued from previous page)*

Mounting Bars and Brackets

Mounting bars and brackets support clamps to position guide rails and sensors. Bars and brackets are made of stainless steel, except Style 22, which is black plastic. Mounting fasteners not included, except for Style 20.

(22&23) Mounting brackets are in two pieces that can be offset for extra clearance between the conveyor and the guide rail or sensor.

(24) Bars for sensors mount with *Style 28* clamp to position sensors and reflectors.



20	4½″ Ht. Mounting Bar	**9268K87**	$13.20

24	5″ Ht. Bar for 18 mm Sensors	**9268K84**	16.26

Rail Clamps and Connectors

Components are made of stainless steel, unless otherwise stated.

(25-27) Rail clamps are used with threaded mounting rods or mounting brackets to hold guide rails in place. *Styles 25 and 27* include hardware for mounting. *Style 26* has a 5⁄16″ dia. mounting hole (fasteners not included).

(28) Rail clamp for mounting rods and bars connects a guide rail to a mounting rod, mounting bar, or sensor bar. Made of black plastic.

(29&30) Rail connectors join two guide rails. *Style 29* taps on with a hammer. *Style 30* includes bolts and nuts for a stronger connection.

25	Rail Clamp	**9268K51**	$3.20

30	Heavy Duty Rail Connector	**9268K136**	14.24

Guide Rails, Brushes, and Roller Rails

(31-36) Guide rails have UHMW polyethylene wear strips and are USDA compliant. *Styles 31-34* have stainless steel channels. *Styles 35-36* have a white low-friction wear strip and a stainless steel core.

(37) Flexible brushes have a PVC backing and white nylon bristles.

(38&39) Roller rails keep things moving where items tend to jam. Rails have gray acetal rollers and include 5⁄16″-18 bolts for mounting. *Style 38* has an aluminum channel. *Style 39* has a PVC channel.

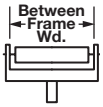
Material & Pipe Support Stands

Material Support Stands



Feed materials into drill presses, band saws, and other equipment with less lifting. Frames are steel.

(A&B) Stands have folding legs with nonskid rubber end caps. Roller is 1⅞″ dia. and made of steel. *Style B* also has a stationary support stand and ⅝″ dia. ball transfers; ball spacing is 2″.

(C) Feet have flanges with a ⅜″ dia. hole for mounting. Roller is 2″ dia. and made of steel.

(D) Four legs with adjustable leveling feet provide stability. Roller is 1.9″ dia. and made of galvanized steel.

(E&F) Stands have multiple 1⅜″ dia. galvanized steel rollers. Roller spacing is 4″. Legs have adjustable leveling feet. *Style E* is 18″ Lg.×15″ Wd. *Style F* is 66″ Lg.×15″ Wd. and has folding legs.

(G) The top rail is 18″ wide and has 1″ dia. steel ball transfers; ball spacing is 2″. Feet have flanges with a ⅜″ dia. hole for mounting.

Build-Your-Own Material Support Stands

V-Style Support

Wheel Support

Roller Support

Optional Sleeve for V Style

Optional Ball Transfers for V Style

Tripod Frame

Folding Tripod Frame

Combine a support with a frame below to build your own stand (all sold separately). Together, the stand height adjusts from 28″ to 49″.

Supports

V-style support has 4″ Lg.×3″ Wd. arms.
Wheel supports have two 4″ dia. wheels.
Roller support holds both round and flat material. Roller is 2″ dia. and made of steel. Between frame width is 10″.
Optional sleeve and ***ball transfers*** slide onto the arms of the V-style support. Fasteners included. *Note:* Using the optional ball transfers reduces the capacity of the frame to 1,000 lbs.

	Material	For Pipe OD	Cap., lbs.		Each
V-Style Support	Steel	⅛″ to 36″	2,000	8732T21	$39.71
Wheel Support	Steel	1¼″ to 24″	2,000	8732T22	58.08
Wheel Support	Stainless Steel	1¼″ to 24″	2,000	8732T23	90.72

Optional Ball Transfers for V Style	Stainless Steel	⅜″ to 12″	1,000	8732T34	124.22

Frames

Frames are steel. *Folding tripod* frame stores in less space.

	Cap., lbs.		Each
Tripod	2,000	8732T26	$76.93
Folding Tripod	2,000	8732T27	93.82

V-Style Material Support Stands

Shown with Optional V Wheels and Casters

Support pipe and bar stock while cutting and welding. Stands and accessories are steel.

(H) Stands have two 1″ dia. ball transfers to feed and rotate material. Ball transfers for 5006T66 adjust to three positions along each arm. Legs have nonskid rubber end caps.

(J) Two 2″ dia. rollers provide smooth material feed. Feet have flanges with ⅜″ dia. holes for mounting.

(K) Each arm is flat and 12″ long. Legs have adjustable leveling feet. *Optional V wheels* mount into the arms to make rotating material easier. Wheels are 4″ dia. *Optional casters* have 8″ dia. steel wheels with a brake.

	For Pipe OD	Cap., lbs.	Height		
H	Up to 3″	150	24″ to 40″	5006T65	$126.45
H	Up to 6″	200	24″ to 40″	5006T66	138.76
J	Up to 4″	400	25¾″ to 38″	5006T71	74.36
K	4″ to 36″	2,500	27″ to 39″	5006T72	333.92
Optional V Wheels for Style K (Set of 4)				5006T73	83.75
Optional Casters for Style K (Set of 5)				5006T94	336.18

Adjustable Pipe Support Stands

Tabletop Stand

Stand sits on your work surface and allows you to position pipe perpendicular or parallel to the frame. Frame is steel with four 4½″ dia. steel wheels and 1½″ dia. axles. Wheels adjust to fit 3″ to 30″ OD pipe. Capacity is 2,500 lbs. Overall size is 17½″ Lg.×6½″ Wd.×6¼″ Ht.

2683T15 ..... **Each** $98.36

Build-Your-Own Stands

Tabletop Frame with Ball Transfer Supports

Fixed Ht. Frame with Steel Wheel Supports

Combine a frame and a pair of supports to create a tabletop or floor stand. Position the supports along the top of the frame to fit ½″ to 36″ OD pipe.

Frames— Made of steel. *Tabletop* frame is 22″ Lg.×6″ Wd. and has four flanges with ½″ dia. holes for mounting to your work surface.

Supports— *Ball transfers* are 1½″ dia. *Wheels* are 4″ dia. Stainless steel wheels are more corrosion resistant than steel wheels.

	Cap., lbs.		Each
Frames			
Tabletop	2,000	2683T24	$107.92
Fixed 24″ Ht.	2,000	2683T25	154.76

Stainless Steel Wheel	2,000	2683T22	105.92

Glass-Filled Nylon Frame Hand Trucks

With a frame made of black glass-filled nylon, these trucks are as strong as steel yet as lightweight as aluminum.

Both trucks have a steel handle and load plate. Stair glides on the back let you easily move your load up and down stairs and over curbs. Trucks roll on 10″ dia. wheels. Shipped assembled.

Pneumatic wheels are quiet and shock absorbing. ***Cushion rubber-tread wheels*** handle heavy loads and provide a cushioned ride.

Cap., lbs.	Load Plate, Wd. × Dp.	Handle Ht.		Each

Steel Hand Truck with Wood Handles

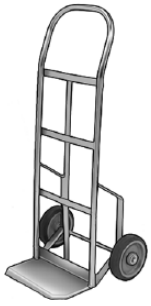
Wood handles are more comfortable to hold in hot and cold environments, and they make these trucks quieter and more shock absorbing than all-metal trucks.

Frame is 11-ga. steel with a green powder-coated finish. Truck rolls on 10″ dia. rubber-tread wheels.

Cap., lbs.	Load Plate, Wd. × Dp.	Handle Ht.		Each
1,000	23″ × 6″	57″	2604T24	$466.85

Steel Hand Trucks

With Optional Fold-Down Load Plate Extension



A ***B*** ***C*** ***D*** ***E*** ***F***

Trucks

All welded-steel construction offers you the most durable hand trucks around.

Cushion rubber-tread wheels will not go flat and provide a cushioned ride. ***Pneumatic wheels*** are quiet and shock absorbing. ***Rubber-tread wheels*** handle heavy loads and roll smoothly over rough surfaces. ***Steel wheels*** are ideal for heavy loads.

Heavy duty trucks are made of heavy gauge steel so they stand up to abuse and demanding applications. ***Trucks with stair glides*** make it easier to move loads up and down stairs and over curbs.

(C) Also known as shovel-nose trucks, these trucks have a tapered load plate.
(D) Reduce your tilting effort by 66%. A spring-loaded pedal allows the axle to shift farther from the load plate during tilting.
(E) Has two rear wheels for increased stability and better mobility. Has a tapered load plate.
(F) Type 304 stainless steel offers superior corrosion resistance in washdown and other harsh environments.

Light Duty Fold-Up Hand Trucks

9940T52 Shown

Take them anywhere—these trucks fold up for easy transport and space-saving storage. All have a telescoping handle and a shock cord to secure your load. Handle and frame are made of steel. Load plate is chrome-plated steel wire. Stair glides on the back let you easily move up and down stairs and over curbs. Shipped assembled.

Rubber-tread wheels are quiet and protect your floors.

Never-go-flat wheels (also known as semi-pneumatic) are quiet and shock absorbing, and you won't have to worry about having a flat.

9940T52 provides increased stability and better mobility with two fold-down legs that have swivel casters with 3″ dia. solid rubber wheels.

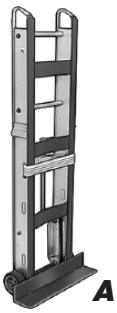
Hand Trucks with Safety Straps



A

B

C

Also known as appliance trucks, these durable hand trucks secure your load with a 2″ wide web strap and a ratchet-style tightener. They also feature padded contact surfaces to protect your load and rotating rubber stair climbers on the back for easy moving up and down stairs and over curbs. Shipped assembled.

(A) Two-wheel aluminum truck is lighter than the steel trucks and has a cotton strap. Frame has a 2″ wide contact surface. The load plate has a red powder-coated finish. Side-mounted hand grips offer better control.

(B) Two-wheel steel truck has a nylon strap and an automatic strap recoil device that stores excess strap. Frame has a red powder-coated finish.

(C) Four-wheel steel trucks offer additional support with two fold-down legs that have swivel casters with 3½″ dia. thermoplastic rubber (TPR) wheels. All have a nylon strap and an automatic strap recoil device that stores excess strap. Frame has a red powder-coated finish.

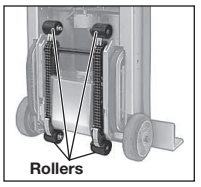
Stair-Climbing Battery-Powered Hand Trucks

Let the truck do the work for you—motorized rotating rollers on the back of these trucks make moving heavy items on stairs easier. Rollers are 2″ dia. polyurethane and run on a ½-hp, 50-amp motor powered by a sealed, maintenance-free battery. A circuit breaker and a battery charger with a 5′10″ long cord with three-prong plug are included. A 2″ wide polyester strap with a ratchet-style tightener secures the load and an automatic recoil device stores excess strap. Trucks are made of magnesium and roll on two rubber-tread wheels. Shipped assembled.



Rollers

Cap., lbs.	Load Plate, Wd. × Dp.	Handle Ht.	Wheel Dia.		Each

850	24″ × 4″	72″	6″	2849T2	3,257.09

Optional Load Plate Extension—Slips over the load plate to increase size to 28″ Wd. × 12″ Dp. Made of steel.

2849T4 ..... **Each** $149.51

Multitask Hand/Platform/Dolly Trucks

A telescoping frame and folding handles let you easily convert from a hand truck to a one- or two-handled platform truck to a dolly in minutes. Trucks are steel with a textured black powder-coated finish. Stair glides let you easily move your load up and down stairs and over curbs.

In the hand truck position, trucks roll on two polyurethane wheels; in the platform truck and dolly positions they roll on the two polyurethane wheels and two swivel casters with thermoplastic rubber (TPR) wheels. Shipped assembled except for wheels and casters, which must be installed (hardware is included).

Cap., lbs.	Platform Size, Lg. × Wd.	Handle Ht.	Wheel Dia.		Each
500	28″ to 42½″ × 12½″	24″	8″/4″	2838T1	$167.71
500	34″ to 52″ × 13½″	32″	8″/5″	2838T2	203.75

Convertible Hand/Platform Trucks

Trucks

Removable handles let you convert the truck by moving the handle from the hand truck position to the platform truck position. ***Quick convert*** have a lever that releases the platform to fold down when needed and to lock against the frame when not in use. Shipped assembled.

Black Glass-Filled Nylon Frame Truck—Lightweight and an economical alternative to aluminum. The handle is steel with a black powder-coated finish. Stair glides on the back let you easily move your load up and down stairs and over curbs. As a platform truck, it rolls on two pneumatic wheels and two swivel casters with polypropylene wheels.

Steel Trucks—Have a red powder-coated finish. As a platform truck, they roll on two rubber wheels (unless noted) and two swivel casters with polypropylene wheels.

Aluminum Trucks—As a platform truck, they roll on two pneumatic wheels and two swivel casters with thermoplastic rubber (TPR) wheels. One caster has a side wheel brake.

Aluminum Battery-Powered Trucks—The same as the aluminum trucks above but have a drive motor to move heavy loads over long distances as well as up and down inclines. They have a handle-mounted variable speed control with forward and reverse functions. The drive can be disengaged for manual use. Trucks include a battery charger with 5′10″ long cord with three-prong plug.

Battery Powered

Aluminum Quick Convert

Dual Battery Pack for 2389T72 ***and T73***—Ideal for high usage applications. Both batteries are enclosed in a case that plugs into the motor and keeps one battery charging while the other is in use.

2389T74 ..... **Each** $394.02

High-Stack Narrow Platform Trucks

Tall handles on each end let you stack higher than other trucks, and a narrow platform allows for maneuvering in tight spaces. Color is gray. The removable handles are steel with a powder-coated finish. Trucks have two rigid wheels in the center of the platform and two swivel casters at each end of the platform. This design allows for tight turns and turning in place. Wheels are polyurethane, unless otherwise stated. Shipped assembled.

Plastic platform is steel reinforced and has a nonslip surface. Center wheels are rubber tread. ***Steel platform*** has a nonslip diamond pattern on the surface.

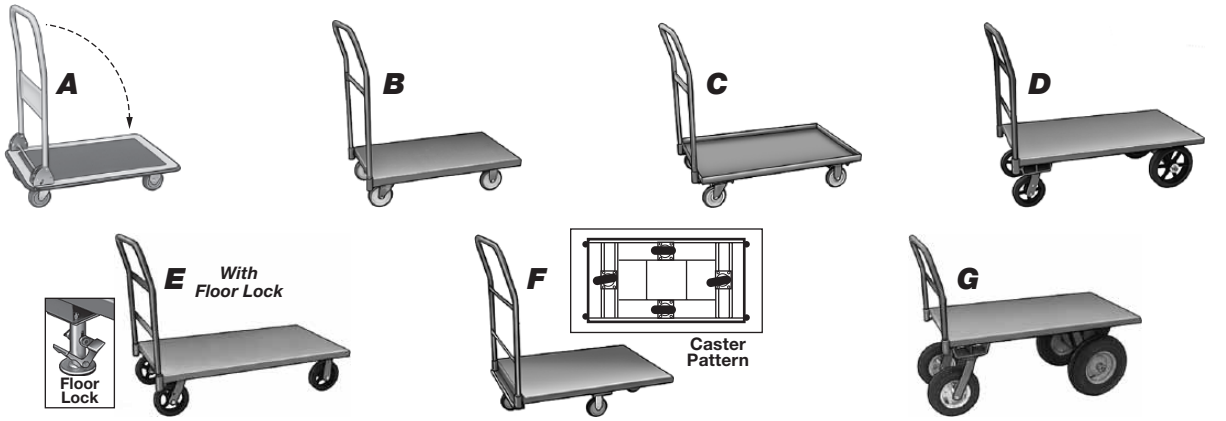
Steel Platform Trucks



Rugged steel trucks offer a variety of capacities and wheel materials for handling light to heavy duty applications. All roll on two rigid and two swivel casters and are shipped assembled (unless noted). For Stainless Steel Platform Trucks, please see page 1330.

Rubber-tread wheels roll smoothly over rough surfaces. ***Polyurethane wheels*** are smooth rolling and nonmarking. ***Pneumatic wheels*** are quiet and shock absorbing. ***Thermoplastic rubber (TPR) wheels*** roll over rough surfaces and are nonmarking and chemical resistant.

Light Duty Trucks— Have a spring-loaded fold-down handle for convenient storage, protective bumpers, and a nonslip blue vinyl surface on the top of the platform. Trucks have a beige enamel finish.

Medium Duty Trucks— Have a removable handle and a gray powder-coated finish. *Lipped platforms* have a 1½″ high lip that prevents your load from slipping off.

Heavy Duty Trucks— Have a removable handle and are made of heavy gauge steel to withstand demanding applications.

Flush platforms and *flush platforms with floor lock* have a gray powder-coated finish on the platform and a blue powder-coated finish on the handle.

Flush platform quick turns have a gray powder-coated finish. Casters are mounted in a diamond pattern to allow for tighter turns and better maneuverability.

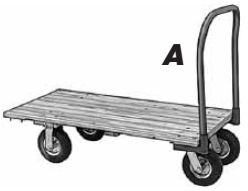
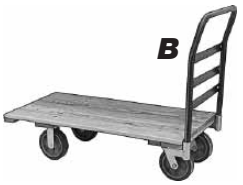
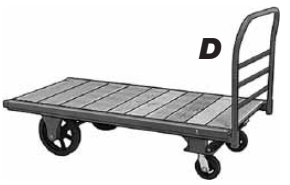
♦ Has thermoplastic rubber (TPR) wheels and is shipped unassembled. ★ Platform height is 7½″; wheel dia. is 5″.
● Swivel casters have a face wheel brake.

Warning! ***Never exceed capacities.***

Wood Platform Trucks







Not only are trucks with a wood platform quieter, they grip your load and absorb impact better than trucks with a steel platform. All have a removable steel handle. Trucks roll on two rigid and two swivel casters. ***Rubber-tread wheels*** roll smoothly over rough surfaces. ***Polyurethane wheels*** are smooth rolling and nonmarking. ***Pneumatic wheels*** are quiet and shock absorbing.

(A) Handle has a green powder-coated finish.

(B) Handle has a blue painted finish. *Trucks with polyurethane wheels* have a side wheel brake on the swivel casters.

(C) A steel edge around the platform and steel reinforcing offer support, stability, and protection. Handle has a blue painted finish.

(D) A steel edge around the platform and steel reinforcing offer support, stability, and protection. Handle has a gray powder-coated finish.

Ergonomic Raised Platform Trucks

Be good to your back—the raised platform on these trucks provides a comfortable work height to reduce the amount of bending over while loading and unloading. Frame and removable handle are made of steel with a powder-coated finish. Trucks roll on two rigid and two swivel casters with rubber-tread wheels.

Swivel casters are available with and without a side wheel brake.

Steel platforms offer better strength and durability compared to wood and plastic. Color is red.

Wood platforms are impact absorbing and quieter than steel. Frame and handle are red.

Plastic platforms are lightweight and resist dents and corrosion. Color is red.

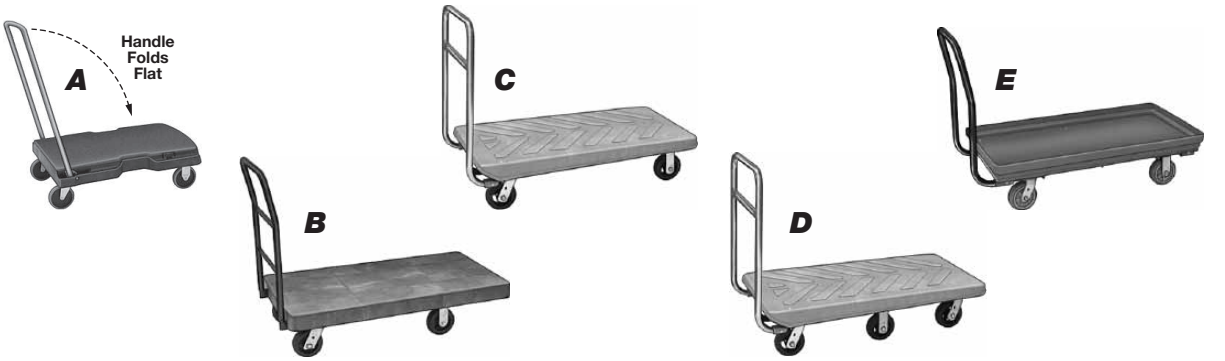
Plastic Platform Trucks



Plastic platforms resist corrosion and dents. Trucks have a removable handle and two rigid and two swivel casters (unless noted). *Styles A* and *B* are shipped unassembled. *Styles C-E* are shipped assembled.

Steel-reinforced platforms offer added strength and durability.

(A) Has a nonremovable three-position handle that folds down flat so truck can be used as a dolly. Platform is black with a nonslip surface; handle is steel with a gray epoxy finish. Casters have thermoplastic rubber (TPR) wheels.

(B) Platform is black with a textured surface; handle is steel with a red powder-coated finish. Wheels are rubber, unless noted.

(C) Platform is gray with a nonslip surface and a protective front bumper; handle is zinc-plated steel. Casters have rubber-tread wheels.

(D) Have the same features as *Style C*, but have four swivel casters and two rigid casters in the center of the platform for easier turning and maneuverability.

(E) Offer a 3″ high lip on the platform that prevents your load from sliding off. The platform is blue and has drainage holes. Handle is steel with a black powder-coated finish and can be used in the handle pockets located at either end of the platform. Casters have thermoplastic rubber (TPR) wheels.

Warning! ***Never exceed capacities.***

Stake Trucks

Wood Platform

Steel Platform

Stakes at each corner hold your load in place during transport and are easily removed for quick unloading. Shipped assembled.

Rubber-tread wheels roll smoothly over rough surfaces. ***Polyurethane wheels*** handle heavier loads and are nonmarking.

Wood platforms absorb minor impact and reduce noise. They have two rigid wheels and two swivel casters mounted in a diamond pattern for better maneuverability. ***Steel platforms*** are more durable than wood. They have two rigid and two swivel casters with side wheel brakes.

Motorized Platform Trucks

Move heavy material without the physical stress of pushing and pulling—these trucks have a totally enclosed, maintenance-free drive system that moves up to 1,000 lbs.

The drive system runs on two rechargeable 12-volt batteries and includes an 8-ft. long self-retracting cord with three-prong plug. Battery charges in five to six hours. Trucks run approximately 15 miles/6 hours per charge.

Trucks are steel with a white powder-coated finish. The reinforced platform has a black nonskid surface. The handle-mounted controller has a two-speed switch, dual thumb controls for forward and reverse, a horn, and an emergency stop switch.

Trucks roll on four swivel casters with thermoplastic rubber (TPR) wheels and have two pneumatic drive wheels. Shipped assembled.

Polypropylene Carts

A

With Optional 4-gal. Utility Bin

B

C

D

Made of strong yet lightweight polypropylene, these carts resist dents and corrosion. Shipped unassembled.

To Order: Please specify color where necessary.

Thermoplastic rubber (TPR) wheels roll over rough surfaces and are nonmarking and chemical resistant. ***Pneumatic wheels*** are quiet and shock absorbing.

Optional drawers mount under the top shelf. They can be locked and include two keys. Mounting hardware is included.

(A) Shelves have a 1″ high lip on three sides and a ¼″ high lip on one side. Frame is aluminum. Carts roll on four swivel casters.

(B) Same as *Style A*, but it has enclosure panels on three sides.

(C) Shelves have a 2¾″ high lip on all sides to prevent items from sliding off. Handle has built-in bins. Rounded corners protect walls and furniture from damage. Carts roll on two rigid and two swivel casters.

(D) Top shelf has recessed edge to catch small parts; bottom shelf has a 2½″ high lip on each end. Handle has built-in bins. Rounded corners protect walls and furniture from damage. Carts roll on two rigid and two swivel casters.

Food-Grade Polyethylene Carts

With Three Shelves

Carts meet NSF/ANSI standards. They have a 7/16″ high lip around the shelves to contain spills and prevent items from sliding off. The frame is chrome-plated steel. Carts roll on four swivel casters. *4″ dia. wheels* are thermoplastic (TPR) rubber; *5″ dia. wheels* are rubber. Shipped unassembled. **To Order:** Please specify shelf color: blue or gray.

Carts with three shelves have a middle shelf that adjusts in 1″ increments.

Plastic Workbenches with Sliding Lid

A sliding lid offers two great functions—a work surface and a locking cover. The lid slides in either direction to extend your work surface. You also can remove the lid completely and store it on the side of the cart. To secure items stored in the top compartment, the lid can be locked with a padlock (not included) that has a maximum shackle diameter of 3/16″.

The workbench is made of gray plastic and has a handle with built-in tool holders at each end. The top compartment has a 3 1/4″ inside height; bottom shelf has a 3″ high lip. Top compartment and lower shelf have a drain plug. Workbench rolls on four swivel casters with solid rubber wheels. Two of the casters have a side wheel brake. Shipped unassembled.

Plastic Workbenches

Workbench

Cabinet Workbench

Workbench with Locking Top and Drawer

These workbenches won't rust or dent. All are made of black plastic and roll on two rigid and two swivel casters (two with brake) with rubber wheels. Shipped unassembled.

Workbench has two removable compartmentalized bins at each end and two bins that slide out from either side. Handle has a built-in bin for small items. The bottom shelf has a 2 3/4″ high lip on the ends to keep items from sliding off.

Cabinet workbench is the same as the plastic workbench above, but has a locking cabinet for additional secure storage. Two keys are included.

Workbench with locking top and drawer has a locking top that flips up to reveal a 1 1/2″ deep compartmentalized tray. A locking drawer mounted under the top offers additional secure storage. Drawer is 4″ deep; capacity is 40 lbs. The two included keys fit both the top and the drawer. Workbench also has four hanging hooks and a three-receptacle outlet strip with a 10-ft. long power cord and three-prong plug. The bottom shelf has a 4 1/2″ high lip to keep items from sliding off.

Polypropylene Cleaning Carts

A

B

A place for everything—these carts hold your brooms, mops, buckets, cleaning supplies, floor signs, and more. All have three shelves and a front platform ideal for holding a mop bucket. Carts also have grips that accommodate handles up to 1 1/8″ diameter and a yellow vinyl bag that has a side zipper and attaches to the handle. Carts roll on two 8″ dia. rigid thermoplastic (TPR) wheels and two swivel casters with 4″ dia. thermoplastic (TPR) wheels. Shipped unassembled.

(A) Top and bottom shelves have a 3″ high lip; middle shelf and front platform have a 1 1/2″ high lip. Cart has six handle grips. Bag capacity is 20.8 gallons. Color is blue (unless noted).

(B) Top shelf has two removable 10-qt. caddies that each hold six spray bottles. Middle shelf has a 3/4″ high lip; bottom shelf has a 6 3/4″ high lip; and the front platform has a 3 3/4″ high back with a 1 3/4″ high lip on each side that tapers to 1/2″ high in front. Cart has five handle grips and a dust pan holder. Bag capacity is 34 gallons. Shelves and front platform are black.

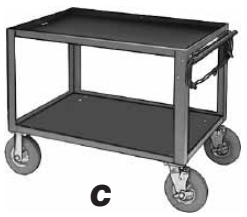
Light Duty Carts with Electrical Outlet Strips



4874T17 Shown

Don't get stuck without an outlet strip and power cord. Also known as A/V and audio/visual carts, these carts come with a three-receptacle, three-prong, 15-amp outlet strip with a 15-ft. long power cord and three-prong plug. Outlet strips are UL listed and CSA certified, except Style C, which is not CSA certified. Shelves have a 1/4" high lip (unless noted). Carts roll on four swivel casters; two with a side wheel brake (unless noted).

Steel carts are heavier and more durable than polyethylene carts. Styles A and B have a black powder-coated finish. Shipped unassembled. Style A is steel. It has a nonslip mat on the top shelf. Style B is steel with plastic shelves. The top shelf has two nonslip strips. Style C has a gray powder-coated finish and includes a nonslip mat on each shelf. Shipped assembled.

Polyethylene carts are lightweight and will not dent or rust. Color is black. Shipped unassembled.

Carts with locking cabinet provide secure storage. They have a recessed handle and include two keys.

(A) *Adjustable-height* carts' top shelf adjusts in 2" increments.

(C) Shelves have a 1½" high lip. Cart rolls on two rigid and two swivel casters. The swivel casters have a side wheel brake.

(D) All shelves have a slip-resistant surface. *Adjustable-height* carts' top shelf adjusts to heights of 16", 26", 34", and 42".

Also Available: Carts with shelves in other colors. Please ask for 4731T888 and specify with or without a cabinet, shelf height, and color: blue, gray, orange, red, or yellow.

Gentle-Ride Instrument Carts with No-Slip Shelves

Have a safe journey—the shelves on these steel carts have a nonslip vinyl surface that keeps your load in place. Two rigid and two swivel casters with pneumatic wheels (unless noted) provide a cushioned ride. Color is gray. Shipped assembled.

(F) Have a protective bumper around the top shelf to protect walls and furniture from damage.

(G) *Lipped shelves* have a 1½" high lip.

(H) Have a protective bumper around the top shelf, a 5" deep lockable drawer with two keys, and a six-receptacle, three-prong, 15-amp outlet strip with a 15-ft. long power cord and three-prong plug. The outlet strip is UL listed and has a circuit breaker.

B

C *With Optional Drawer*

D

E

F

G

An economical alternative to welded carts for less demanding applications. All shelves are reversible from a lipped shelf that keeps items from sliding off to a flush shelf for a smooth work surface. Color is gray. Shipped unassembled.

Carts with 3″ dia. wheels roll on four swivel casters with polypropylene wheels.

Carts with 5″ dia. wheels roll on two rigid and two swivel casters with polypropylene wheels.

Carts with drawers can be locked with a padlock (not included) that has a maximum shackle diameter of 1/4″. For padlocks, please see pages 2914-2925.

(B) Shelves are enclosed on three sides. The back panel can be removed to allow access from two sides.

(D) Also includes four bin boxes for additional storage. The swivel casters have a side wheel brake.

(G) Cabinet has a lock with two keys.

Optional Drawer for Style C Carts— Carts accommodate one or two drawers. Drawer is mounted under top shelf with lip up.

Drawer is 18″ Lg. × 12″ Wd. × 4″ Dp. Capacity is 75 lbs.

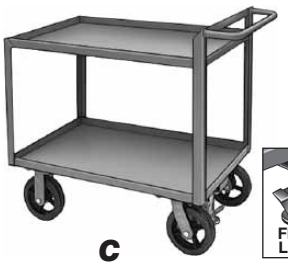
Welded Steel Carts

A

With Two Shelves and Polyurethane Wheels

B



C

With Rubber-Tread Wheels and Floor Lock

D

With Three Shelves

Welded-steel construction offers you the most durable carts around. All shelves are 12-ga. steel. Color is gray. Shipped assembled.

Thermoplastic rubber (TPR) wheels are quiet and protect your floor. ***Polyurethane wheels*** are smooth rolling and nonmarking. ***Rubber-tread wheels*** provide higher capacity and roll smoothly over rough surfaces. ***Phenolic wheels*** are water resistant and an economical choice.

(A) All bottom shelves have a 1½″ high lip. Middle shelf on carts with three shelves is the same (flush or lipped) as the top shelf. Carts roll on two rigid and two swivel casters with a side wheel brake (unless noted).

(B) Have a low top shelf to reduce lifting and a raised offset handle for easier pushing. Bottom shelf has a 1½″ high lip. Carts roll on two rigid and two swivel casters with a side wheel brake.

(C) Have an offset handle for easier pushing and a crossbar to protect your hands when items slide. Carts roll on two rigid and two swivel casters. *Carts with a floor lock* keep cart stationary when loading and unloading.

(D) All shelves are reinforced (unless noted). Carts roll on two rigid and two swivel casters. *Carts with a floor lock* keep cart stationary when loading and unloading.

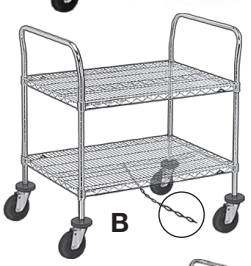
Food-Grade Steel Carts with Adjustable Shelves



Just what you need in food processing, laboratory, and other sanitary environments. Casters have a bumper to protect walls and furniture from damage. Shipped unassembled.

Extra shelves (sold separately) can be added without disassembling the cart.

Wire shelves minimize dust accumulation and maximize air circulation. Shelves adjust in 1″ increments. Carts roll on four swivel casters.

Type 304 stainless steel carts offer superior corrosion resistance. *Washdown casters* have a grease fitting, making them ideal for high-pressure washdown applications. *Conductive chrome-plated steel* carts have a braided cable that dissipates static charges. Surface resistivity is less than 10^3 ohms.

Solid shelves are ideal for small items and items with feet that could fall through wire shelves. Shelves are 18 gauge and adjust in 1″ increments. Carts roll on four swivel casters.

Heavy Duty Welded Type 430 Stainless Steel Carts

A
With Flush Top Shelf

B
With Lipped Top Shelf

Handling heavy loads and withstanding corrosion—that's what these carts are all about. Carts have welded construction. They roll on two rigid and two swivel casters with nonmarking polyurethane wheels; the swivel casters have a side wheel brake. Shipped assembled.

Flush top shelf carts provide a smooth work surface. The bottom shelf is lipped. Carts *with three shelves* have a flush middle shelf.

Lipped top shelf carts keep items from sliding off. All shelves on these carts are lipped.

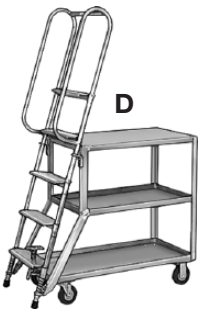
Aluminum Ladder Carts

C



D

No need to lug around a ladder and a cart—these carts do the job of both. A foot pedal on the bottom step activates the built-in floor lock that secures the cart for use as a ladder. Simply step off the ladder to release the floor lock.

All carts have a flush top shelf; middle and bottom shelves have a 1½″ high lip to keep items from sliding off. Shelves are ⅛″ thick.

Rails have nonmarking rubber feet. The steps are 4¾″ Lg.×17″ Wd. Carts roll on two rigid and two swivel casters with nonmarking rubber-tread wheels. Shipped assembled.

(C) Overall height is 50″; top step height is 30″.

(D) Overall height is 71½″; top step height is 50″.

	Cart Cap., lbs.	*Shelf Size, Lg.×Wd.* Top and Middle	Bottom	Shelf Clearance	Top Shelf Ht.	No. of Shelves	Cap. per Shelf, lbs.■	Wheel Dia.

Plated-Steel Wire Basket Carts

Also known as mail carts, these carts have convenient removable baskets. The top basket has removable, adjustable bars to hold letter- and legal-size hanging file folders. Carts have welded construction and a chrome-plated finish. Shipped unassembled.

200-lb. capacity cart rolls on two rigid and two swivel casters with hard rubber wheels. ***250-lb. capacity*** cart has two rigid never-go-flat rubber (also known as semi-pneumatic) wheels and two swivel casters with hard rubber wheels.

250-lb. Capacity

Cart Cap., lbs.	Basket Size, Lg. × Wd. × Ht. Top	Bottom	Basket Clearance	No. of Baskets	Cap. per Basket, lbs.	Handle Ht.	Wheel Dia.		Each

Extra Bottom Basket	1263T72	71.31	1263T92	67.73

Twin-Side Steel Shelf Carts

Carts are divided into two identical sides so you can efficiently organize two operations on one cart. Shelves are solid and mounted at a slight incline (unless noted) to keep your material from sliding off. Carts have a gray enamel finish. Shipped assembled.

Cart with Solid Divider and Sides— Cart rolls on two rigid and two swivel casters with phenolic wheels.

Carts with Mesh Divider and Sides— Bottom shelf has a 1½″ high lip to keep your load from sliding off. Carts roll on two rigid and two swivel casters with rubber-tread wheels. Casters are mounted in a diamond pattern to allow for tighter turns and better maneuverability.

★ Clearance from bottom shelf is 12″. ● Bottom shelf is flat and made of 12 ga. steel.

Three-Sided Mesh-Panel Steel Shelf Carts

Stack 'em high and have easy access to your load. Tall mesh panels on three sides give you good visibility and prevent your load from slipping off. All carts have a solid flush bottom shelf and a gray powder-coated finish. They roll on two rigid and two swivel casters with rubber-tread wheels. Shipped assembled.

Carts with two shelves have a solid top shelf that can be mounted with the 1½″ high lip up or down. Top shelf adjusts in 3½″ increments from 18″ to 48″ high above the bottom shelf using the included mounting clips.

With Two Shelves

Fabric Hampers

Canvas

It doesn't matter if your load is wet or dry, these hampers can handle it. All have a welded spring-steel frame; the bottom support is wood reinforced with welded flat steel. They also have reinforced wear points, fabric handles, and a storage pocket. Hampers nest together for storage. They roll on two rigid and two swivel casters with rubber wheels. Casters are mounted in a diamond pattern to allow for tighter turns and better maneuverability, and they have debris guards to protect the wheel bearings from contamination. Shipped assembled.

Canvas hampers have riveted seams for added strength. Color is white.

Vinyl-coated nylon hampers resist dirt and grease and have a smooth, snag-free surface.

To Order: Please specify color: blue, gray, red, or yellow.

Spring-loaded shelves raise and lower the load for easier loading and unloading. Fabric-covered springs on each corner of the vinyl-covered steel shelf mount inside the hamper.

Also Available: Replacement hamper liners. Please ask for 2555T41 for canvas and specify hamper part number; or 2631T888 for vinyl-coated nylon and specify hamper part number and color.

Elevated Polyethylene Box Trucks

Go easy on your back—these elevated box trucks minimize bending when reaching for loads. The seamless, 1/4″ thick, polyethylene body is strong enough for wet and dry loads. It prevents leaks, resists many chemicals, and can be cleaned with hot water and detergent. The frame is made of tubular steel. Trucks roll on four swivel casters with rubber wheels. Shipped unassembled.

To Order: Please specify color: blue, gray, natural, red, or yellow. *Note:* Red is not recommended for wet materials because color may bleed.

Cap., lbs.	Cap., cu. ft.	Interior Size, Lg. × Wd. × Ht.	Exterior Size, Lg. × Wd. × Ht.	Wheel Dia.		Each
400	5	26″ × 18″ × 18 1/4″	30″ × 22″ × 29 3/4″	3″	22135T3	$234.05

Ribbed-Sidewall Polyethylene Box Trucks

Truck with Steel Frame

Ribbed sidewalls add strength while a seamless interior prevents leaks. The body is made of 1/4″ thick polyethylene that resists many chemicals and can be cleaned with hot water and detergent. The tapered shape allows trucks to nest together for space-saving storage. All casters have rubber wheels and debris guards to protect the wheel bearings from contamination. Shipped assembled.

Trucks with steel frame have a reinforced tubular steel frame with a gray powder-coated finish.

To Order: Please specify color: blue, gray, natural, or red. *Note:* Red is not recommended for wet materials because color may bleed.

Frameless sanitary trucks are made of resins that comply with USDA standards. All have encapsulated hardware and a capped drain for easy cleaning and sanitizing. Casters are mounted directly to the body. Color is natural.

★ Capacity is 760 lbs.; wheel diameter is 5″.

Steel-Reinforced Sidewall Polyethylene Box Trucks

Standard with Optional Hinged Lid

Towable

Don't fight the battle of bulging anymore. These trucks can hold higher capacities and keep their shape thanks to tubular steel reinforcement on the exterior of the sidewalls. The seamless, 1/4″ thick, polyethylene body prevents leaks, resists many chemicals, and can be cleaned with hot water and detergent. The tapered shape allows trucks to nest together for space-saving storage. Frame is made of tubular steel with a red powder-coated finish. Body is black. All trucks are USDA compliant for meat and poultry. Shipped assembled.

Standard trucks roll on two rigid and two swivel casters with polypropylene wheels. Casters are mounted in a diamond pattern to allow for tighter turns and better maneuverability.

Towable truck has a hinged tow bar that can be locked in an upright position for nontowing applications. Includes a hitch pin coupler for towing a maximum of three trucks. Truck rolls on two rigid and two swivel casters with polyurethane wheels. Maximum tow speed is 5 mph.

Optional hinged lids cover and conceal your load. They add approximately 8 1/2″ to the exterior height (unless noted). Color is black.

Double-Wall Rim Polyethylene Box Trucks

Give 'em your toughest jobs—these trucks have a double-wall top rim that can take the hardest knocks. The body is made of 3/16" thick polyethylene that resists many chemicals and can be cleaned with hot water and detergent. The tapered shape allows trucks to nest together for space-saving storage. All have a molded-in handle and a steel frame. Trucks roll on two axle-mounted rubber wheels and two swivel casters with rubber wheels. Shipped assembled.
