(Continued on following page)

Metric Alloy Steel Socket Head Cap Screws *(Continued from previous page)*

Made from a high-strength alloy steel, these are the metric sizes of our popular alloy steel screws. They have a Class 5g6g thread fit, a minimum Rockwell hardness of C38, and minimum tensile strength of 170,000 psi, except the black-oxide Class 8.8 alloy steel assortment. Dimensions meet DIN 912/ISO 4762. Length is measured from under the head.

Black-oxide Class 12.9 alloy steel screws have a dark surface color.

High-visibility blue Class 12.9 alloy steel screws have a distinctive blue color that makes them easy to distinguish from inch screws and are zinc plated for corrosion resistance.

Black-Oxide Class 12.9 Alloy Steel (Cont.)

Corrosion-Resistant Coated Alloy Steel Socket Head Cap Screws

Full Threads

Partial Threads

Protective coatings add corrosion resistance. Screws are fully threaded, unless noted. They have a minimum Rockwell hardness of C37, and a minimum tensile strength of 170,000 psi. Length is measured from under the head. Inch screws have a Class 3A thread fit. Metric screws have a Class 5g6g thread fit.

Zinc-Plated Screws—Suitable for outdoor use. Inch sizes conform to ASTM A574. Metric sizes are Class 12.9 alloy steel and meet DIN 912/ISO 4762.

Zinc-Coated Screws—A thick zinc coating makes them 20 times as corrosion resistant as zinc-plated screws and comparable to Dacromet coated screws. They're made from Class 12.9 alloy steel. Dimensions meet DIN 912/ISO 4762.

Ultra Corrosion-Resistant Coated Screws—They have a zinc basecoat, an aluminum topcoat, and withstand 1,000 hours of salt spray per ASTM B117. Also known as Magni coated screws, they're about twice as corrosion resistant as zinc-coated screws and 40 times as corrosion resistant as zinc-plated screws. Inch sizes conform to ASTM A574 and meet ANSI/ASME B18.3. Metric sizes are made from Class 12.9 alloy steel and meet DIN 912/ISO 4762.

(Continued on following page)

Corrosion-Resistant Coated Alloy Steel Socket Head Cap Screws *(Continued)*

Full Threads

Partial Threads

Protective coatings add corrosion resistance. Screws are fully threaded, unless noted. They have a minimum Rockwell hardness of C37, and a minimum tensile strength of 170,000 psi. Length is measured from under the head. Inch screws have a Class 3A thread fit. Metric screws have a Class 5g6g thread fit.

Zinc-Plated Screws—Suitable for outdoor use. Inch sizes conform to ASTM A574.

Zinc-Coated Screws—A thick zinc coating makes them 20 times as corrosion resistant as zinc-plated screws and comparable to Dacromet coated screws. They're made from Class 12.9 alloy steel. Dimensions meet DIN 912/ISO 4762.

Ultra Corrosion-Resistant Coated Screws—They have a zinc basecoat, an aluminum topcoat, and withstand 1,000 hours of salt spray per ASTM B117. Also known as Magni coated screws, they're about twice as corrosion resistant as zinc-coated screws and 40 times as corrosion resistant as zinc-plated screws. Metric sizes are made from Class 12.9 alloy steel and meet DIN 912/ISO 4762.

Locking Alloy Steel Socket Head Cap Screws

Thread Locking

With Captive Lock Washer

Flanged

Serrated Flange

Screws have a locking element to resist loosening. They're made from black-oxide alloy steel and are fully threaded, unless noted. Length is measured from under the head.

Thread-Locking Screws—A nylon patch bonded to the threads withstands temperatures from –70° to 250° F. Screws are reusable. *Inch sizes* have a Class 3A thread fit, a min. Rockwell hardness of C37, and a min. tensile strength of 170,000 psi. They conform to ASTM A574 and meet ANSI/ASME B18.3. *Metric sizes* have a Class 5g6g thread fit, a min. Rockwell hardness of C39, and a min. tensile strength of 175,000 psi. They meet DIN 912/ISO 4762.

Screws with Captive Lock Washer—A permanently attached but freely rotating split lock washer provides tension to resist loosening. Also known as Sems screws, they have a Class 3A thread fit, a Rockwell hardness of C39, and a min. tensile strength of 180,000 psi.

Flanged Screws—The flange distributes holding power and covers irregular or oversized holes. *Inch sizes* have a Class 3A thread fit, a min. Rockwell hardness of C20, and min. tensile strength of 100,000 psi. *Metric sizes* have a Class 6g thread fit, a min. Rockwell hardness of C39, and a min. tensile strength of 175,000 psi.

Serrated Flange Screws—Like flanged screws but with notches that dig into the surface to hold fast. The flange covers irregular or oversized holes. Screws have a Class 5g6g thread fit, a Rockwell hardness of C39, and a min. tensile strength of 145,000 psi.

Precise-Length Partially Threaded Stainless Steel Socket Head Cap Screws

Get the exact amount of threading you need. Screws have a flanged head that distributes holding power and covers irregular or oversized holes. Screws are made from 18-8 stainless steel. They have a Class 3A thread fit, a minimum Rockwell hardness of B83, and a minimum tensile strength of 85,000. Length is measured from under the head.

Low-Profile Alloy Steel Socket Head Cap Screws

Full Threads

Partial Threads

For low-strength applications where clearance is limited, these screws have a head that's about half the height of a standard socket head. Screws are fully threaded, unless noted. Length is measured from under the head.

Inch Sizes—Meet ASTM A574. They have a Class 3A thread fit, a minimum Rockwell hardness of C39, and a minimum tensile strength of 145,000 psi.

Metric Sizes—Meet DIN 7984. They have a Class 6g thread fit, a minimum Rockwell hardness of C20, and a minimum tensile strength of 115,000 psi.

Stainless Steel Socket Head Cap Screws

Choose stainless steel screws when you need corrosion resistance. They have a Class 3A thread fit, a minimum Rockwell hardness of B70, and a minimum tensile strength of 70,000 psi. Length is measured from under the head.

(Continued on following page)

Stainless Steel Socket Head Cap Screws *(Continued from previous page)*

Choose stainless steel screws when you need corrosion resistance. They have a Class 3A thread fit, a minimum Rockwell hardness of B70, and a minimum tensile strength of 70,000 psi. Length is measured from under the head.

Type 316 Stainless Steel (Cont.)

Stainless Steel Socket Head Cap Screws *(Continued from previous page)*

Full Threads

Partial Threads

Choose stainless steel screws when you need corrosion resistance. They have a Class 3A thread fit, a minimum Rockwell hardness of B70, and a minimum tensile strength of 70,000 psi. Length is measured from under the head.

Metric Stainless Steel Socket Head Cap Screws

Use these screws when you need corrosion resistance in a metric screw that meets DIN standards. They have a Class 6g thread fit, a minimum tensile strength of 70,000 psi, and are not rated for hardness. Screws are fully threaded, unless noted. Length is measured from under the head.

Locking Stainless Steel Socket Head Cap Screws

Screws have a locking element to resist loosening. They have a minimum Rockwell hardness of B70 and a minimum tensile strength of 70,000 psi, except metric thread-locking screws are not rated for hardness. Screws are fully threaded, unless noted. Length is measured from under the head.

Thread-Locking Screws—A nylon patch bonded to the threads withstands temperatures from –70° to 250° F. Screws are reusable. *Inch sizes* have a Class 3A thread fit. Dimensions meet ANSI/ASME B18.3. *Metric sizes* have a 6g thread fit. Dimensions meet DIN 912.

Screws with Captive Lock Washer—A permanently attached but freely rotating split lock-washer provides constant tension. Also known as Sems screws, they have a Class 3A thread fit and meet ASTM F837.

Thread-Locking Screws—Type 316 Stainless Steel

M2, M3, M4, M5, M6, M8, M10, M12	4, 5, 6, 8, 10, 12, 16, 20, 25, 30, 35, 40, 50	93705A800

Coated Stainless Steel Socket Head Cap Screws

Made of 18-8 stainless steel, these screws have a Class 3A thread fit, a minimum Rockwell hardness of B70, and a minimum tensile strength of 70,000 psi. They're fully threaded, unless noted. Length is measured from under the head.

Black oxide screws have a matte-black finish.

Silver plated screws offer mild lubricity to resist seizing.

Nickel-chrome plated screws have a decorative, mirror-like finish. Use them with optional plugs to block debris and provide a finished look.

Mil. Spec. Socket Head Cap Screws

Screws meet stringent Military Specifications (MS) and National Aerospace Standards (NAS), except A286 super alloy screws meet NAS only. They have a Class 3A thread fit and are fully threaded, unless noted. Length is measured from under the head.

300 series stainless steel and **A286 super alloy** screws are passivated to QQ-P-35 and meet FF-S-86. *300 series stainless steel* screws have a minimum tensile strength of 80,000 psi and are not rated for hardness. *A286 super alloy screws* have a Rockwell hardness of C33 and a minimum tensile strength of 160,000 psi.

Cadmium-plated alloy steel screws have a minimum Rockwell hardness of C39 and a minimum tensile strength of 180,000 psi.

High-Strength Corrosion-Resistant Socket Head Cap Screws

Full Threads

Partial Threads

These screws retain their strength in corrosive environments. They're fully threaded, unless noted. Length is measured from under the head.

17-4 PH Stainless Steel—Stronger than Grade 5 steel screws and as corrosion resistant as those made from 18-8 stainless steel, these have a minimum tensile strength of 135,000 psi. They also have a Class 3A thread fit and a minimum Rockwell hardness of C28.

Bumax 88 Stainless Steel—With strength comparable to Grade 5 steel screws and corrosion resistance similar to that of Type 316 stainless steel, these have a minimum tensile strength of 116,000 psi. They have a Class 2A thread fit and meet ANSI/ASME B18.3. Screws are not rated for hardness.

Nickel—Screws are more corrosion resistant than Type 316 and Bumax 88 stainless steel and resistant to salt water and some acids. They have a min. tensile strength of 70,000 psi, a Class 3A thread fit, and a min. Rockwell hardness of B60.

Titanium—Resistant to salt water, chemicals, and acids, these are our most corrosion resistant screws. Along with a high strength to weight ratio, they have a minimum tensile strength of 50,000 psi, a Class 2A thread fit, and a minimum Rockwell hardness of B80. All meet ASME B18.3.

Low-Profile Stainless Steel Socket Head Cap Screws

Low Profile

Ultra-Low Profile

For use where space is limited, these screws have heads that are a fraction of the height of standard socket head cap screws. Not recommended for high-strength fastening, they have a minimum tensile strength of 70,000 psi. They are fully threaded, unless noted. Inch sizes have a minimum Rockwell hardness of B70 and a Class 3A thread fit, except ultra-low profile screws have a Class 2A thread fit. Metric sizes have a Class 6g thread fit and are not rated for hardness.

Low-profile screws have a head that's about half the height of standard socket head screws. Length is measured from under the head.

Ultra-low profile screws have a head that's 2/3 the height of low-profile screws and 1/3 the height of standard cap screws. It is wide and acts like a flange to reduce the likelihood of crushing thin or soft materials. Head strength is reinforced by a small shoulder and an unthreaded portion under the shoulder approximately 1 1/2 to 2 threads in length. Length is measured from under the shoulder.

Brass and Bronze Socket Head Cap Screws

Brass and bronze screws are corrosion resistant, nonmagnetic, and excellent conductors of electricity. They're also fully threaded and have a Class 3A thread fit. Length is measured from under the head.

Brass screws have a minimum Rockwell hardness of B55 and a minimum tensile strength of 55,000 psi.

Bronze screws are 30% stronger and more corrosion resistant than brass screws to salt water, gases, and sewage. They have a minimum Rockwell hardness of B70 and a minimum tensile strength of 70,000 psi.

Aluminum Socket Head Cap Screws

Our aluminum socket head cap screws are extremely lightweight. They have a Class 3A thread fit and are not rated for hardness or tensile strength. Length is measured from under the head and screws are fully threaded, unless noted.

To Order: Please specify anodized blue, anodized red, or plain silver.

★ Has partial threads. Thread length is 1" to 1 1/4".

Conformable Soft-Point Socket Head Cap Screws

The tip holds textured and curved material with minimal surface damage. These high-strength alloy steel screws have a black-oxide finish, strength comparable to Grade 8 steel screws, and conform to ASTM A574. They have a Class 3A thread fit, a minimum Rockwell hardness of C39, and a minimum tensile strength of 180,000 psi. Screws meet ANSI/ASME B18.3 and are reusable. They are fully threaded, unless noted. Length is measured from under the head.

Nylon Point—Softer than brass and nonconductive, the nylon point reduces vibration and eliminates damage from metal touching metal. Made from nylon 6/6, the point withstands temperatures from –50° to 250° F and has a minimum Rockwell hardness of R105.

Brass Point—The point is harder than nylon and conductive. Not rated for hardness.

■ Has partial threads. Thread length is 3/4" to full.

Plastic Socket Head Cap Screws CAD

Full Threads

Partial Threads

These screws are lightweight, resistant to most chemicals and solvents, and electrically nonconductive. They're fully threaded, unless noted. Length is measured from under the head. They are not rated for hardness or tensile strength and are not recommended for high-strength fastening. Inch sizes have an approximate Class 2A thread fit. Metric sizes are not rated for thread fit.

Nylon—Temperature range is –40° to 185° F. Exposure to moisture may cause nylon to expand.

Glass-Filled Nylon—Reinforced with fiberglass, these screws have more than twice the strength of nylon. They are not rated for temperature. Exposure to moisture may cause nylon to expand.

Polypropylene—Screws are more resistant than nylon to acids, alkalies, oils, and grease. Unlike nylon screws, they won't absorb moisture. Temperature range is –20° to 212° F.

Nylon—Choose a color: black, off-white

Wire-Lockable Socket Head Cap Screws

For more vibration resistance than a thread-locking patch or a lock washer, wire these screws together through a hole in the head (wire sold separately below). For wire-twisting pliers, see page 2747. Screws are fully threaded, unless noted. All have a Class 3A thread fit and meet ANSI/ASME B18.3. Length is measured from under the head.

Black-Oxide Alloy Steel—These screws have strength comparable to Grade 8 screws, a minimum Rockwell hardness of C37, and a minimum tensile strength of 170,000 psi.

18-8 Stainless Steel—Material meets ASTM F837. Screws have a minimum Rockwell hardness of B70 and a minimum tensile strength of 80,000 psi.

Full Threads

Partial Threads

Use wire (not included) to lock screws together.

Vented Socket Head Cap Screws

Used in vacuum systems, these precision manufactured screws are drilled through the shaft to vent fluid and gas. They're made from 18-8 stainless steel. Screws are fully threaded, unless noted. They are not rated for hardness or tensile strength. Length is measured from under the head.

Inch sizes have a Class 3A thread fit.

Metric sizes have a Class 4g6g thread fit.

▲Has partial threads. For thread length, go to mcmaster.com and search for the part number.

Sealing Socket Head Cap Screws

A silicone O-ring under the head prevents fluids and gases from flowing into or out of a tapped hole. O-ring temperature range is –80° to 400° F. Screws are 18-8 stainless steel. They're fully threaded and have a Class 3A thread fit.

Minimum Rockwell hardness is B100 and minimum tensile strength is 55,000 psi. All meet ASME B18.3. Length is measured from under the head.

Alloy Steel Flat-Head Socket Cap Screws

Full Threads

Thread Locking

Designed with a beveled neck and a flat head, these screws sit flush within countersunk holes. They have a minimum Rockwell hardness of C32 and a minimum tensile strength of 120,000 psi, except mil. spec. cadmium-plated screws have a minimum tensile strength of 145,000 psi and a minimum Rockwell hardness of C39. Screws are fully threaded, unless noted. Length is measured from the top of the head. These screws are not recommended for high-strength fastening.

Inch Screws—Have a Class 3A thread fit, an 82° bevel under the head, and meet ASTM F835. *Thread-locking* screws have a nylon patch bonded to the threads that prevents loosening. The patch withstands temperatures from –65° to 250° F. Screws are reusable.

Metric Screws—Have a Class 6g thread fit and a 90° bevel under the head. They meet DIN 7991/ISO 10642, unless noted. *High-visibility blue* screws have a distinctive blue color that makes them easy to distinguish from inch screws and are zinc plated for corrosion resistance.

▲ Has partial threads. For thread length, go to mcmaster.com and search for the part number.
★ Head is undercut to allow more threading.

(Continued on following page)

Alloy Steel Flat-Head Socket Cap Screws *(Continued from previous page)*

Designed with a beveled neck and a flat head, these screws sit flush within countersunk holes. They have a minimum Rockwell hardness of C32 and a minimum tensile strength of 120,000 psi, except mil. spec. cadmium-plated screws have a minimum tensile strength of 145,000 psi and a minimum Rockwell hardness of C39. Screws are fully threaded, unless noted. Length is measured from the top of the head. These screws are not recommended for high-strength fastening.

Inch Screws—Have a Class 3A thread fit, an 82° bevel under the head, and meet ASTM F835. *Thread-locking* screws have a nylon patch bonded to the threads that prevents loosening. The patch withstands temperatures from –65° to 250°F. Screws are reusable.

Metric Screws—Have a Class 6g thread fit and a 90° bevel under the head. They meet DIN 7991/ISO 10642, unless noted. *High-visibility blue* screws have a distinctive blue color that makes them easy to distinguish from inch screws and are zinc plated for corrosion resistance.

Zinc-Plated Alloy Steel

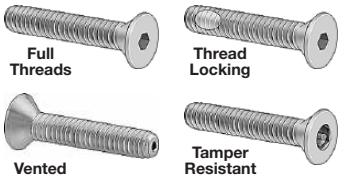
Stainless Steel Flat-Head Socket Cap Screws



Use for light fastening jobs where you need a flush surface and corrosion resistance. Screws are fully threaded, unless noted. Length is measured from the top of the head.

Inch Screws—All have an 82° bevel under the head and a Class 3A thread fit. Minimum Rockwell hardness is B55 and minimum tensile strength is 70,000 psi, except vented screws are not rated for hardness or strength and mil. spec. screws are not rated for hardness.

Thread-locking screws have a nylon patch bonded to the threads to prevent loosening. The patch withstands temperatures from –65° to 250°F. Screws are reusable. *Vented* screws are drilled through the shaft to vent fluids and gas. *Mil. spec.* screws are passivated in accordance with QQ-P-35 for added protection against oxidation and corrosion. *Tamper-resistant* screws require a pin-in-hex driver.

Metric Screws—All have a 90° bevel under the head. They also have a Class 6g thread fit, a minimum tensile strength of 100,000 psi, and are not rated for hardness.

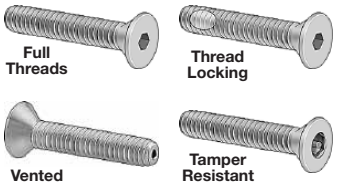
▲ Has partial threads. For thread length, go to mcmaster.com and search for the part number.
★ Head is undercut to allow more threading.

(Continued on following page)

Stainless Steel Flat-Head Socket Cap Screws *(Continued from previous page)*



Use for light fastening jobs where you need a flush surface and corrosion resistance. Screws are fully threaded, unless noted. Length is measured from the top of the head.

Inch Screws—All have an 82° bevel under the head and a Class 3A thread fit. Minimum Rockwell hardness is B55 and minimum tensile strength is 70,000 psi, except vented screws are not rated for hardness or strength and mil. spec. screws are not rated for hardness.

Thread-locking screws have a nylon patch bonded to the threads to prevent loosening. The patch withstands temperatures from –65° to 250°F. Screws are reusable. *Vented* screws are drilled through the shaft to vent fluids and gas. *Mil. spec.* screws are passivated in accordance with QQ-P-35 for added protection against oxidation and corrosion. *Tamper-resistant* screws require a pin-in-hex driver.

Metric Screws—All have a 90° bevel under the head. They also have a Class 6g thread fit, a minimum tensile strength of 100,000 psi, and are not rated for hardness.

Stainless Steel 100° Flat-Head Socket Cap Screws CAD

A shallower, wider bevel than standard flat heads makes these screws better for use in thin material. Made from Type 316 stainless steel, they have a 3A thread fit, a minimum Rockwell hardness of B70, and a minimum tensile strength of 70,000 psi. Screws are fully threaded with an undercut head. Length is measured from the top of the head. These screws are not recommended for high-strength fastening.

Brass Flat-Head Socket Cap Screws CAD

Full Threads

These screws are corrosion resistant, nonmagnetic, and excellent conductors of electricity. They have an 82° bevel under the head, a Class 3A thread fit, a minimum Rockwell hardness of B55, and a minimum tensile strength of 55,000 psi. Screws are fully threaded, unless noted. Length is measured from the top of the head. Not recommended for high-strength fastening.

▲Has partial threads. For thread length, go to mcmaster.com and search for the part number.

Stainless Steel Button-Head Socket Cap Screws

The button head provides a wide bearing surface, a low head, and a finished appearance. These screws are fully threaded, unless noted. Length is measured from under the head. Not recommended for high-strength fastening.

Inch Screws—Have a Class 3A thread fit. They also have a minimum Rockwell hardness of B55 and a minimum tensile strength of 70,000 psi. *Thread-locking* screws have a nylon patch bonded to the threads that prevents loosening. The patch withstands temperatures from –70° to 250° F.

Metric Screws—Have a Class 6g thread fit, a minimum tensile strength of 70,000 psi, and are not rated for hardness.

Type 316 Stainless Steel

Stainless Steel Button-Head Socket Cap Screws *(Continued from previous page)*

The button head provides a wide bearing surface, a low head, and a finished appearance. These screws are fully threaded, unless noted. Length is measured from under the head. Not recommended for high-strength fastening.

Inch Screws—Have a Class 3A thread fit. They also have a minimum Rockwell hardness of B55 and a minimum tensile strength of 70,000 psi. *Thread-locking* screws have a nylon patch bonded to the threads that prevents loosening. The patch withstands temperatures from –70° to 250° F.

Metric Screws—Have a Class 6g thread fit, a minimum tensile strength of 70,000 psi, and are not rated for hardness.

Thread-Locking 18-8 Stainless Steel

Alloy Steel Button-Head Socket Cap Screws

Full Threads

Thread Locking

For a finished appearance, these screws have a low rounded head. A wide bearing surface distributes the load. They're fully threaded, unless noted. Length is measured from under the head. Not recommended for high-strength fastening.

Inch Screws—Meet ASTM F835. Strength is comparable to that of Grade 5 screws. They have a Class 3A thread fit, a minimum Rockwell hardness of C37, and a minimum tensile strength of 120,000 psi. *Thread-locking* screws have a nylon patch bonded to the threads to resist loosening. The patch withstands temperatures from –70° to 250° F.

Metric Screws—Have dimensions that meet ISO 7380, unless noted. Strength is comparable to that of Grade 8 screws. They have a Class 6g thread fit, a minimum Rockwell hardness of C32, and a minimum tensile strength of 142,000 psi, except Torx drive screws have a minimum Rockwell hardness of C22 and a minimum tensile strength of 115,000 psi. *High-visibility blue* screws are colored to distinguish them from inch sizes and are zinc plated for corrosion resistance.

▲Has partial threads. For thread length, go to mcmaster.com and search for the part number.

(Continued on following page)

Alloy Steel Button-Head Socket Cap Screws *(Continued from previous page)*

Full Threads

Thread Locking

For a finished appearance, these screws have a low rounded head. A wide bearing surface distributes the load. They're fully threaded, unless noted. Length is measured from under the head. Not recommended for high-strength fastening.

Inch Screws—Meet ASTM F835. Strength is comparable to that of Grade 5 screws. They have a Class 3A thread fit, a minimum Rockwell hardness of C37, and a minimum tensile strength of 120,000 psi. *Thread-locking* screws have a nylon patch bonded to the threads to resist loosening. The patch withstands temperatures from –70° to 250° F.

Metric Screws—Have dimensions that meet ISO 7380, unless noted. Strength is comparable to that of Grade 8 screws. They have a Class 6g thread fit, a minimum Rockwell hardness of C32, and a minimum tensile strength of 142,000 psi, except Torx drive screws have a minimum Rockwell hardness of C22 and a minimum tensile strength of 115,000 psi. *High-visibility blue* screws are colored to distinguish them from inch sizes and are zinc plated for corrosion resistance.

Brass Button-Head Socket Cap Screws

These screws have a low, smooth, decorative head and are excellent conductors of electricity. They're fully threaded and have a Class 3A thread fit. Minimum Rockwell hardness is B55; minimum tensile strength is 55,000 psi. Screw length is measured from under the head. These screws are not recommended for high-strength fastening.

Flanged Button-Head Socket Cap Screws

A built-in washer keeps the screw head from crushing thin material. Screws are fully threaded, unless noted. Inch sizes have a Class 3A thread fit. Metric sizes have a Class 6g thread fit. Screw length is measured from under the flange. These screws are not recommended for high-strength fastening.

Stainless steel screws have a minimum Rockwell hardness of B70 and a minimum tensile strength of 70,000 psi.

Alloy steel screws have a minimum Rockwell hardness of C32 and a minimum tensile strength of 120,000 psi.

Tamper-Resistant Button-Head Socket Cap Screws

Difficult to remove without special tools, use these screws in public spaces to add safety and security. *18-8 stainless steel* have a minimum Rockwell hardness of B70 and a minimum tensile strength of 70,000 psi. *Black-oxide alloy steel* have a minimum Rockwell hardness of C38 and a minimum tensile strength of 135,000 psi. Screws are fully threaded, unless noted. Length is measured from under the head. These screws are not recommended for high-strength fastening.

Pin-in-Torx—Use with the tamper-resistant Torx drivers and bits on pages 2814 and 2819. Thread fit is Class 3A.

Pin-in-Hex—Use with the tamper-resistant hex drivers and bits on pages 2811 and 2820. Thread fit is Class 3A.

High Security—Have a unique drive that is sold only by McMaster-Carr. Thread fit is Class 2A. Use with the driver bits sold separately, below.

About Cap Screws and Bolts

Choosing a Style

Cap screws and bolts for general-purpose fastening are listed here. For machine T-slot bolts, T-handle bolts, hold-down bolts, anchor bolts, and hanger bolts, see pages 3180-3181.

Hex Head Cap Screws (pages 3145-3170)

Fully threaded screws can be screwed all the way into a threaded or tapped hole. They are also known as tap bolts.

Partially threaded screws have an unthreaded portion under the head that adds strength but prevents them from being screwed all the way into a threaded hole.

Flange Head Screws (pages 3170-3174)

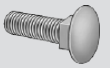
A built-in washer covers oversized holes and distributes the load to reduce stress at the connection point.

Heavy Hex Head Bolts (pages 3176-3177)

The wide head distributes the load and a precise unthreaded portion matches the thickness of the material being fastened.

Square Head Bolts (page 3177)

A square head provides more contact with a wrench than a hex head for a secure grip while tightening nuts.

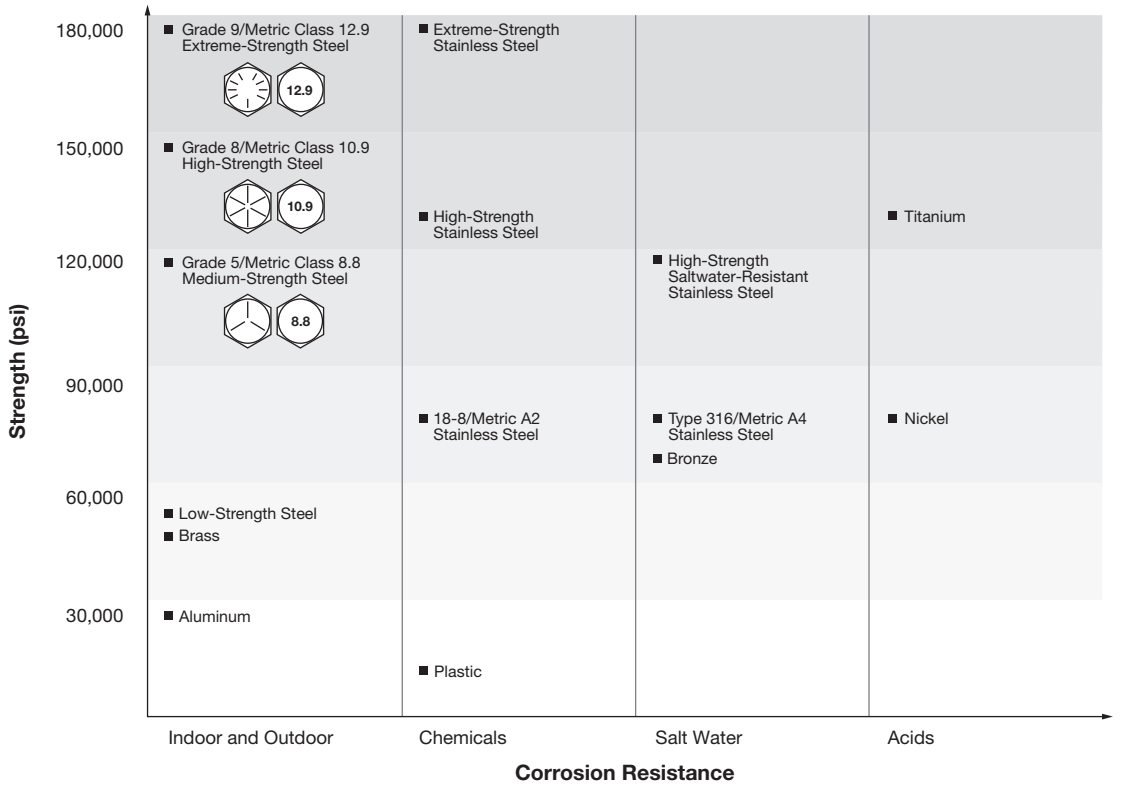


Carriage, Plow & Elevator Bolts (pages 3178-3179)

A square or ribbed neck keeps these bolts from turning when tightening a nut.

Comparing Materials by Strength and Corrosion Resistance

Use the chart below as a guide to understanding the relative strength and corrosion resistance of the screws and bolts we offer.



Other Material Properties to Consider

Steel is magnetic.

Stainless Steel may be mildly magnetic. 18-8 stainless steel includes Types 301, 302, 303, and 304.

Nickel may be mildly magnetic.

Brass and **Bronze** are nonmagnetic and conduct electricity.

Aluminum is extremely lightweight—it's 70% lighter than steel.

Titanium has a high strength-to-weight ratio. It's comparable in strength to medium-strength (Grade 5) steel, yet 40% lighter.

Plastic is nonconductive.

Extreme-Strength Steel Cap Screws—Grade 9

With a hefty head that's 20% taller than a standard cap screw head and a minimum tensile strength of 180,000 psi, these are our strongest cap screws. They are made from alloy steel with a zinc yellow-chromate plating for rust resistance. All have nine radial markings to indicate Grade 9. They have a minimum Rockwell hardness of C38 and a Class 2A thread fit. Length is measured from under the head.

For nuts, see page 3207; for washers, see page 3245.

High-Strength Steel Cap Screws—Grade 8

The standard for high-strength cap screws, these are made from alloy steel and are marked on the head with six radial lines to indicate Grade 8. Screws have a minimum tensile strength of 150,000 psi, a minimum Rockwell hardness of C33, and a Class 2A thread fit. They also meet ASME B18.2.1 and SAE J429, unless noted. Length is measured from under the head.

Zinc yellow-chromate plated screws are rust resistant.

Uncoated screws have a dark surface color.

(Continued on following page)

High-Strength Steel Cap Screws—Grade 8 *(Continued from previous page)*

The standard for high-strength cap screws, these are made from alloy steel and are marked on the head with six radial lines to indicate Grade 8. Screws have a minimum tensile strength of 150,000 psi, a minimum Rockwell hardness of C33, and a Class 2A thread fit. They also meet ASME B18.2.1 and SAE J429, unless noted. Length is measured from under the head.

Zinc yellow-chromate plated screws are rust resistant.

Uncoated screws have a dark surface color.

Zinc Yellow-Chromate Plated (Cont.)

(Continued on following page)

High-Strength Steel Cap Screws—Grade 8 *(Continued from previous page)*

The standard for high-strength cap screws, these are made from alloy steel and are marked on the head with six radial lines to indicate Grade 8. Screws have a minimum tensile strength of 150,000 psi, a minimum Rockwell hardness of C33, and a Class 2A thread fit. They also meet ASME B18.2.1 and SAE J429, unless noted. Length is measured from under the head.

Zinc yellow-chromate plated screws are rust resistant.

Uncoated screws have a dark surface color.

★ Meets ASME B18.2.1 and ASTM A354BD. Screws are Grade 8 but may not have radial lines.

Screws with Material Certification

These zinc yellow-chromate plated steel screws come with a traceable lot number and a physical and chemical report.

Corrosion-Resistant Coated High-Strength Steel Cap Screws—Grade 8

Also known as ultra coat and armor coat, these zinc-aluminum-plated screws have a silver-colored coating and are five times as corrosion resistant as standard zinc-plated screws. Screws are made from alloy steel and are marked on the head with six radial lines to indicate Grade 8. They have a minimum tensile strength of 150,000 psi, a minimum Rockwell hardness of C33, and a Class 2A thread fit. They also meet ASME B18.2.1 and SAE J429. Length is measured from under the head. For nuts, see page 3207. For washers, see page 3245.

Tension-Indicating Steel Cap Screws

Indicator color changes as tension increases.

An indicator dot changes from red to black when these screws are properly tightened. It then changes back to red if they come loose. The indicator is reliable at temperatures from –4° to 168°F. Screws are made from alloy steel and have a zinc yellow-chromate plating for rust resistance. They have a minimum Rockwell hardness of C33 and a Class 2A thread fit. Although not rated for strength, these screws have at least 85% of the tensile strength of equivalent size Grade 8 hex head cap screws. Length is measured from under the head.

Medium-Strength Steel Cap Screws—*Grade 5*

Full Threads

Partial Threads

An economical alternative to Grade 8 steel, these screws are at least 60% as strong. They're marked on the head with three radial lines to indicate Grade 5 and have a Class 2A thread fit. Screws meet ASME B18.2.1 and SAE J429, unless noted. Length is measured from under the head.

Zinc-plated screws have a minimum tensile strength of 120,000 psi and a minimum Rockwell hardness of C25.

Uncoated screws have a minimum tensile strength of 100,000 psi and a minimum Rockwell hardness of C19, unless noted.

Semi-gloss black and **matte black** screws have a minimum tensile strength of 120,000 psi and a minimum Rockwell hardness of C25. *Semi-gloss black* withstand 1,000 hours of salt spray per ASTM B117 and are our most corrosion resistant medium-strength screws. *Matte black* have a nonreflective surface that provides lubricity.

Zinc Plated

(Continued on following page)

Medium-Strength Steel Cap Screws—Grade 5 *(Continued from previous page)*

An economical alternative to Grade 8 steel, these screws are at least 60% as strong. They're marked on the head with three radial lines to indicate Grade 5 and have a Class 2A thread fit. Screws meet ASME B18.2.1 and SAE J429, unless noted. Length is measured from under the head.

Zinc-plated screws have a minimum tensile strength of 120,000 psi and a minimum Rockwell hardness of C25.

Uncoated screws have a minimum tensile strength of 100,000 psi and a minimum Rockwell hardness of C19, unless noted.

Semi-gloss black and **matte black** screws have a minimum tensile strength of 120,000 psi and a minimum Rockwell hardness of C25. *Semi-gloss black* withstand 1,000 hours of salt spray per ASTM B117 and are our most corrosion resistant medium-strength screws. *Matte black* have a nonreflective surface that provides lubricity.

Zinc Plated (Cont.)

Low-Strength Steel Cap Screws

Use these cap screws for general purpose applications. Made from steel with strength similar to that of Grade 2 steel, they have a minimum tensile strength of 60,000 psi, a minimum Rockwell hardness of B69, and a Class 2A thread fit. Length is measured from under the head. Screws meet ASME B18.2.1 and ASTM A307 (unless noted). For smaller screws, see hex-head machine screws on pages 3053-3054.

Zinc-plated screws have a thin layer of zinc for rust resistance.

Hot-dipped galvanized screws have a thick zinc coating that offers 10 times more rust resistance than zinc plating. They must be used with the hot-dipped galvanized nuts on page 3208.

■ Meets ASME B18.2.1 and SAE J429.

(Continued on following page)

Low-Strength Steel Cap Screws *(Continued from previous page)*

Use these cap screws for general purpose applications. Made from steel with strength similar to that of Grade 2 steel, they have a minimum tensile strength of 60,000 psi, a minimum Rockwell hardness of B69, and a Class 2A thread fit. Length is measured from under the head. Screws meet ASME B18.2.1 and ASTM A307 (unless noted). For smaller screws, see hex-head machine screws on pages 3053-3054.

Zinc-plated screws have a thin layer of zinc for rust resistance.

Hot-dipped galvanized screws have a thick zinc coating that offers 10 times more rust resistance than zinc plating. They must be used with the hot-dipped galvanized nuts on page 3208.

Zinc Plated (Cont.)

■ Meets ASME B18.2.1 and SAE J429.

Metric Extreme-Strength Steel Cap Screws—Class 12.9

Our strongest metric cap screws, these have a minimum tensile strength of 170,000 psi. They also have a dark surface color, a minimum Rockwell hardness of C39, and a Class 6g thread fit. All meet DIN 933. Length is measured from under the head.

Metric High-Strength Steel Cap Screws—Class 10.9

The standard for high-strength metric cap screws, these are made from material that's comparable to Grade 8 steel. They have a minimum tensile strength of 150,000 psi and a minimum Rockwell hardness of C32. Length is measured from under the head. Fully threaded screws meet DIN 933. Partially threaded screws meet DIN 931.

Zinc yellow-chromate plated screws are rust resistant and have a Class 6h thread fit.

Uncoated screws have a dark surface color and a Class 6g thread fit.

High-visibility blue screws have a distinctive blue color that makes them easy to distinguish from inch screws and are zinc plated for corrosion resistance. They have a Class 6g thread fit.

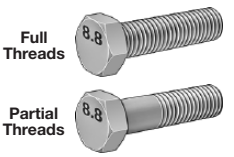
Metric Medium-Strength Steel Cap Screws—Class 8.8

Screws are made from heat-treated steel that's comparable to Grade 5 steel. They have a minimum tensile strength of 115,000 psi and a minimum Rockwell hardness of C21. Length is measured from under the head. Sizes M6 and larger are marked on the head with 8.8. Zinc-plated and zinc yellow-chromate plated screws are rust resistant. Uncoated screws have a dark surface color.

Zinc Plated and **Uncoated**—Screws have a Class 6h thread fit. Fully threaded screws meet DIN 933, except fine and extra-fine pitch screws meet DIN 961. Partially threaded screws meet DIN 931, except fine and extra-fine pitch screws meet DIN 960.

JIS Zinc Yellow-Chromate Plated—Made to Japanese Industrial Standards, these screws meet JIS B 1180. They have a Class 6g thread fit.



Zinc Plated

(Continued on following page)

Metric Medium-Strength Steel Cap Screws—Class 8.8 *(Continued from previous page)*

Screws are made from heat-treated steel that's comparable to Grade 5 steel. They have a minimum tensile strength of 115,000 psi and a minimum Rockwell hardness of C21. Length is measured from under the head. Sizes M6 and larger are marked on the head with 8.8. Zinc-plated and zinc yellow-chromate plated screws are rust resistant. Uncoated screws have a dark surface color.

Zinc Plated and **Uncoated**—Screws have a Class 6h thread fit. Fully threaded screws meet DIN 933, except fine and extra-fine pitch screws meet DIN 961. Partially threaded screws meet DIN 931, except fine and extra-fine pitch screws meet DIN 960.

JIS Zinc Yellow-Chromate Plated—Made to Japanese Industrial Standards, these screws meet JIS B 1180. They have a Class 6g thread fit.

Zinc Plated (Cont.)

Mil. Spec. Steel Cap Screws

Screws are made to stringent military specifications that ensure performance and reliability. They're fully threaded, unless noted. Length is measured from under the head.

High-strength steel screws meet B1821BH (which supersedes MS-90727 and MS-90728), ASME B18.2.1, SAE J429, and ASTM A354. They're zinc yellow-chromate plated and marked on the head with six radial lines to indicate Grade 8. Minimum tensile strength is 150,000 psi. Minimum Rockwell hardness is C33. Thread fit is Class 2A.

Medium-strength steel screws meet MS-90725. They're cadmium-plated, which provides more corrosion resistance than zinc plating. Screws are marked on the head with three radial lines to indicate Grade 5. Minimum tensile strength is 120,000 psi. Minimum Rockwell hardness is C25. Thread fit is Class 2A.

Army-Navy medium-strength steel screws meet AN (Army-Navy) specifications. They're cadmium-plated and marked on the head with one line to indicate corrosion resistance. Available with and without a drilled shank, those with a drilled shank are also known as cotter-pin bolts. They're drilled so you can add a cotter pin to keep a nut from loosening. Minimum tensile strength is 125,000 psi. Minimum Rockwell hardness is C26. Thread fit is Class 3A.

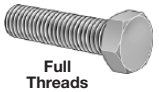
Mil. Spec. Stainless Steel Cap Screws



Made to the same stringent standards as our Mil. Spec. steel cap screws with more corrosion resistance, these 300 series stainless steel screws meet FF-S-85 and are passivated to QQ-P-35 for protection against oxidation and corrosion. They have a minimum tensile strength of 70,000 psi, a minimum Rockwell hardness of B74, and a Class 2A thread fit. Fully threaded, unless noted. Length is measured from under the head.

▲Has partial threads. For thread length, go to mcmaster.com and search for the part number.

High-Strength Stainless Steel Cap Screws

These screws are stronger than and just as corrosion resistant as Type 316 and 18-8 stainless steel screws. They're fully threaded. Length is measured from under the head. Inch sizes have a Class 2A thread fit and dimensions that meet ASME B18.2.1. Metric sizes have a Class 6g thread fit.

17-4 PH stainless steel screws are as strong as Grade 5 steel and as corrosion resistant as 18-8 stainless steel. They have a min. tensile strength of 135,000 psi and a min. Rockwell hardness of C28. Material meets ASTM F593 Grade 630 and is magnetic.

A286 stainless steel screws are almost as strong, hard, and corrosion resistant as 17-4 PH stainless steel. They have a min. tensile strength of 130,000 psi and a min. Rockwell hardness of C24. Material meets ASTM A453 Grade 660 and is not magnetic. Screws are used in high-temperature applications such as gas turbines.

Saltwater-resistant Bumax 88 stainless steel screws are more corrosion resistant than 17-4 PH stainless steel and A286 stainless steel, but not as strong. Screws are often used in oil drilling rigs and other marine environments. They're nonmagnetic, have a min. tensile strength of 116,000 psi, and are not rated for hardness.

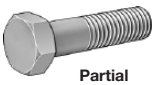
Stainless Steel Cap Screws



Made from stainless steel, these screws are corrosion resistant in harsh environments. They may be mildly magnetic. Minimum tensile strength is 70,000 psi and minimum Rockwell hardness is B70. Thread fit is Class 2A. Dimensions meet ASME B18.2.1. Length is measured from under the head. For screws in sizes 4-40 to 12-24, see hex-head machine screws on page 3045.

Type 316 stainless steel screws are more corrosion resistant than 18-8 stainless steel screws and can be used in marine environments.

18-8 stainless steel screws resist chemicals and solvents.

(Continued on following page)

Stainless Steel Cap Screws *(Continued from previous page)*

Made from stainless steel, these screws are corrosion resistant in harsh environments. They may be mildly magnetic. Minimum tensile strength is 70,000 psi and minimum Rockwell hardness is B70. Thread fit is Class 2A. Dimensions meet ASME B18.2.1. Length is measured from under the head. For screws in sizes 4-40 to 10-24, see hex-head machine screws on page 3053.

18-8 stainless steel screws resist chemicals and solvents.

Stainless Steel Cap Screws *(Continued from previous page)*

Made from stainless steel, these screws are corrosion resistant in harsh environments. They may be mildly magnetic. Minimum tensile strength is 70,000 psi and minimum Rockwell hardness is B70. Thread fit is Class 2A. Dimensions meet ASME B18.2.1. Length is measured from under the head. For screws in sizes 4-40 to 10-24, see hex-head machine screws on page 3053.

18-8 stainless steel screws are resistant to chemicals and solvents.

Metric Stainless Steel Cap Screws

The metric version of our stainless steel cap screws, these also offer corrosion resistance in harsh environments. They may be mildly magnetic. Minimum tensile strength is 100,000 psi and hardness is not rated. Screws have a Class 6g thread fit. Length is measured from under the head. Fully threaded screws meet DIN 933. Partially threaded screws meet DIN 931.

Type 316 (A4) stainless steel is more corrosion resistant than 18-8 stainless steel and can be used in marine environments.

18-8 (A2) stainless steel withstands chemicals and solvents.

(Continued on following page)

Metric Stainless Steel Cap Screws *(Continued from previous page)*

The metric version of our stainless steel cap screws, these also offer corrosion resistance in harsh environments. They may be mildly magnetic. Minimum tensile strength is 100,000 psi and hardness is not rated. Screws have a Class 6g thread fit. Length is measured from under the head. Fully threaded screws meet DIN 933. Partially threaded screws meet DIN 931.

18-8 (A2) stainless steel withstands chemicals and solvents.

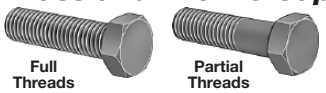
Brass and Bronze Cap Screws



Screws are nonmagnetic, corrosion resistant, and electrically conductive. They're fully threaded (unless noted). Length is measured from under the head. Inch sizes have a Class 2A thread fit and head dimensions that meet ASME B18.2.1. Metric sizes have a Class 6g thread fit.

Brass screws have a minimum tensile strength of 50,000 psi and a minimum Rockwell hardness of B55.

Bronze screws are 30% stronger than brass screws and are extremely resistant to salt water, gases, and sewage. They have a minimum tensile strength of 70,000 psi and a minimum Rockwell hardness of B70.

Aluminum Cap Screws

These low-strength cap screws are 70% lighter than steel and rust resistant. They're fully threaded and have a Class 2A thread fit. Minimum tensile strength is 37,000 psi. Minimum Rockwell hardness is B40. Length is measured from under the head.

Corrosion-Resistant Cap Screws

Extreme corrosion resistance makes these cap screws suitable for use in marine environments and chemical-processing plants. They have a Class 2A thread fit. Minimum tensile strength is 80,000 psi. Minimum Rockwell hardness is B80. Length is measured from under the head.

Nickel screws meet Mil. Spec. S-1222 and ASTM F468. Also known as Monel screws, they're more saltwater resistant than screws made of Type 316 stainless steel. They're fully threaded, unless noted.

Alloy 20 stainless steel screws have dimensions that meet ASME B18.2.1. Also known as Carpenter 20 screws, they have a high nickel content and are resistant to sulfuric acids. Most sizes are partially threaded.

Titanium Cap Screws

These titanium screws are as strong as medium-strength steel and 40% lighter. They resist salt water, chemicals, and acids. Minimum tensile strength is 135,000 psi and minimum Rockwell hardness is C36. These screws are also nonmagnetic, fully threaded (unless noted), and have a Class 2A thread fit. Length is measured from under the head.

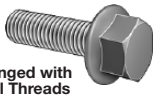
▲Has partial threads. For thread length, go to mcmaster.com and search for the part number.

Plastic Cap Screws



Our plastic cap screws are lightweight, nonconductive, and resist chemicals better than most of their metal counterparts. Length is measured from under the head (or flange where applicable). Fully threaded, unless noted. Not rated for tensile strength or hardness. Inch screws have a Class 2A thread fit. Metric screws have a Class 6g thread fit.

Nylon screws are an economical choice. They are resistant to oils, grease, and solvents (except mineral acids). Exposure to moisture may cause them to expand and become brittle over time.

PVC screws are more resistant to acids and alkalies than nylon screws.

Fiberglass screws are stronger than nylon screws. *Flanged* screws distribute holding pressure to reduce stress where the screw meets the surface of the material you're fastening. Head height includes flange thickness.

PTFE screws surpass most other plastic screws when it comes to chemical resistance and performance in extreme temperatures (–100° to 500° F).

Cap Screws with Washer

A free-rotating, permanently attached washer distributes force over a wider area than a flange for more holding power. Also known as Sems screws, these are made from 18-8 stainless steel and may be mildly magnetic. Screws are fully threaded and have a Class 2A thread fit. Length is measured from under the head. Minimum tensile strength is 100,000 psi and minimum Rockwell hardness is B95.

Flange Head Cap Screws

High-Strength Steel

Medium-Strength Steel

Also known as frame bolts, a flange distributes holding pressure to reduce stress where the screw meets the surface of the material you're fastening. These screws are fully threaded, unless noted. Inch screws have a Class 2A thread fit. Metric screws have a Class 6g thread fit. Head height includes the flange. Length is measured from under the flange.

Extreme-strength steel screws are comparable in strength to Grade 9 steel cap screws. They have a minimum tensile strength of 180,000 psi, a minimum Rockwell hardness of C38, and a black-oxide finish.

High-strength steel screws have a minimum tensile strength of 150,000 psi and a minimum Rockwell hardness of C32. Finish is black-phosphate, except JIS metric high-strength steel screws are zinc-plated. *Inch sizes* meet IFI 111, SAE J429, and are marked on the head with six radial lines to indicate Grade 8.

Medium-strength steel screws have a minimum tensile strength of 115,000 psi and a minimum Rockwell hardness of C22. *Inch sizes* are zinc plated, meet IFI 111, SAE J429, and are marked on the head with three radial lines to indicate Grade 5. *Metric sizes* are zinc yellow-chromate plated.

Extreme-strength stainless steel screws have a minimum tensile strength of 170,000 psi and a minimum Rockwell hardness of C38. Screws are Type 304 or Type 450 stainless steel.

Flange Head Cap Screws *(Continued from previous page)*

Metric High-Strength Steel | Metric Medium-Strength Steel

Also known as frame bolts, a flange distributes holding pressure to reduce stress where the screw meets the surface of the material you're fastening. These screws are fully threaded, unless noted. Metric screws have a Class 6g thread fit. Head height includes the flange. Length is measured from under the flange.

Metric High-Strength Steel—All have a minimum tensile strength of 150,000 psi and a minimum Rockwell hardness of C32. Finish is black-phosphate, except JIS metric high-strength steel screws are zinc-plated.

Metric Medium-Strength Steel—Screws have a minimum tensile strength of 115,000 psi and a minimum Rockwell hardness of C22. They are zinc yellow-chromate plated.

12-Point Flange Head Cap Screws

Full Threads

Partial Threads

The head makes 12 points of contact with the wrench to handle more torque than a hex head or socket head cap screw. The flange distributes holding pressure to reduce stress where the screw meets the surface of the material you're fastening. To install, use a 12-point wrench that matches the head width of your screw. All screws have a minimum tensile strength of 170,000 psi, a minimum Rockwell hardness of C37, and a Class 3A thread fit. They're fully threaded, unless noted. Head height includes the thickness of the flange. Length is measured from under the flange.

Extreme-Strength Steel—Comparable in strength to Grade 9, these screws meet ASTM A574. Dimensions meet IFI-115.

Extreme-Strength Stainless Steel—1/2″ to 1″ long screws are Type 304 stainless steel. 1 1/4″ to 3″ long screws are Type 450 stainless steel.

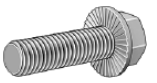
Vibration-Resistant Serrated Flange Head Cap Screws



Serrations beneath the flange bite into surfaces to resist loosening. Screws are fully threaded, unless noted. Head height includes the thickness of the flange. Length is measured from under the flange. Inch screws have a Class 2A thread fit. Metric screws have a Class 6g thread fit.

High-Strength Steel—*Inch sizes* have a minimum tensile strength of 150,000 psi, a minimum Rockwell hardness of C33, and meet IFI-111 and SAE J429. They are zinc-plated and marked on the head with six radial lines to indicate Grade 8. *Metric sizes* have a minimum tensile strength of 130,000 psi, a minimum Rockwell hardness of C27, and a black finish.

Medium-Strength Steel—Screws have a minimum tensile strength of 115,000 psi, a minimum Rockwell hardness of C22, and are zinc plated. *Inch sizes* meet IFI-111 and SAE J429; they're marked on the head with three radial lines to indicate Grade 5. *Metric sizes* have dimensions that meet DIN 6921. *Large-diameter medium-strength steel* screws have a flange that's at least 10% larger than a standard flange for more gripping power.

Stainless Steel—Screws have a minimum tensile strength of 100,000 psi and a minimum Rockwell hardness of B100. *Type 316 stainless steel* screws are more corrosion resistant than 18-8 stainless steel screws and can be used in marine environments. *18-8 stainless steel* screws resist chemicals and solvents.

Thread-Locking Cap Screws

High-Strength Steel

A nylon patch bonded to the threads adds holding power and withstands temperatures from –58° to 250° F. Screws are fully threaded, unless noted. Length is measured from under the head. Inch sizes have a Class 2A thread fit. Metric sizes have a Class 6h thread fit.

High-strength steel screws have a minimum tensile strength of 150,000 psi, a minimum Rockwell hardness of C33, and meet ASME B18.2.1 and SAE J429. They have a zinc yellow-chromate finish and are marked on the head with six radial lines to indicate Grade 8.

18-8 stainless steel screws have minimum tensile strength of 70,000 psi and a minimum Rockwell hardness of B70.

Metric medium-strength steel screws have a minimum Rockwell hardness of C22 and a minimum tensile strength of 116,000 psi. They meet DIN 933 and are zinc plated.

Wire-Lockable Cap Screws

Medium-Strength Steel

Wire screws together so they won't come loose. Wire is sold separately below. For wire twisting pliers, see page 2747. Screws meet ASME B18.2.1 and have a Class 2A thread fit. Fully threaded, unless noted. Length is measured from under the head.

Medium-strength steel screws have a minimum tensile strength of 120,000 psi, a minimum Rockwell hardness of C25, and meet SAE J429. They are zinc plated and marked on top of the head with three radial lines to indicate Grade 5.

18-8 stainless steel screws have a minimum tensile strength of 70,000 psi and a Rockwell hardness of B70.

Use wire (not included) to lock screws together.

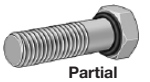
Sealing Cap Screws

Full Threads



Partial Threads

Protect equipment by sealing out contaminants. Screws come with a replaceable silicone O-ring that maintains a seal at pressures up to 20,000 psi (when used in the hole size recommended below).

Screws are 18-8 stainless steel and are reusable. They have a minimum tensile strength of 85,000 psi, a minimum Rockwell hardness of B85, and a Class 2A thread fit. They're fully threaded, unless noted. Length is measured from under the head.

The silicone O-rings have a temperature range of –80° to 400°F and resist salt water and most acids. For an O-ring that stands up to chemicals and oil, replace the O-ring with fluoroelastomer; it also maintains a seal up to 20,000 psi and has a temperature range of –20° to 400°F.

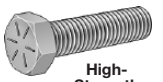
Silicone, Fluoroelastomer	¼″, 5⁄16″, ⅜″, ½″	97284A990

Left-Hand Cap Screws



High-Strength Steel

Use in left-hand threaded holes or with left-hand nuts and in places where counterclockwise motion would cause right-hand threaded screws to come loose. Length is measured from under the head. Screws are fully threaded, except medium-strength steel inch screws may be partially threaded. Inch sizes have a Class 2A thread fit. Metric sizes have a Class 6g thread fit.

High-strength steel screws have a minimum tensile strength of 150,000 psi and a minimum Rockwell hardness of C33. They meet SAE J429 and are marked on the head with six radial lines to indicate Grade 8.

Medium-strength steel screws have a minimum tensile strength of 115,000 psi and a minimum Rockwell hardness of C21. Inch sizes meet SAE J429 and ASME B18.2.1 and are marked on the head with three radial lines to indicate Grade 5.

18-8 stainless steel screws have a minimum tensile strength of 77,000 psi and a minimum Rockwell hardness of B70.

Vented Cap Screws

Used in vacuum systems, these screws are drilled through the shaft to vent fluid and gas. They're made from 18-8 stainless steel and are fully threaded with a Class 2A thread fit. Not rated for hardness or tensile strength. Length is measured from under the head.

Heavy Hex Head Bolts

Structural Bolt

High-Pressure Bolt—Uncoated Steel

These bolts have a wide head that distributes holding pressure. They have a Class 2A thread fit and are partially threaded, unless noted. Length is measured from under the head.

Structural Bolts—These bolts meet ASME B18.2.6 and ASTM A325 Type 1 for structural steel joints. 1/2" to 1" bolts have a minimum tensile strength of 120,000 psi and a minimum Rockwell hardness of C25. 1 1/8" and 1 1/4" bolts have a minimum tensile strength of 105,000 psi and a minimum Rockwell hardness of C19.

Hot-dipped galvanized steel bolts have a thick coating that offers excellent protection against rust, weather, and corrosion. Bolts should be used with hot-dipped galvanized nuts; see 91694A on page 3216.

High-Pressure Bolts—Fasten pressure vessels, valves, and flanges. These bolts meet ASTM A193.

Uncoated steel (Grade B7) bolts meet ASTM A193 Grade B7. They have a minimum tensile strength of 125,000 psi and a maximum Rockwell hardness of C35. For ASTM A194 nuts, see page 3216.

Type 316 stainless steel (Grade B8M) bolts have a minimum tensile strength of 75,000 psi and a maximum Rockwell hardness of B96. For Grade 8M nuts, see 97619A on page 3216.

18-8 stainless steel (Grade B8) bolts have a minimum tensile strength of 75,000 psi and a maximum Rockwell hardness of B100. For ASTM A194 Grade 8 nuts, see 94252A on page 3216.

Square Head Bolts

The square head provides more contact with a wrench than a hex head for a secure grip while tightening nuts. These bolts can be used in square openings to keep them from turning. They're fully threaded, unless noted, and have a Class 2A thread fit. All meet ASME B18.2.1. Length is measured from under the head. For square nuts, see page 3219.

Medium-Strength Steel—Bolts have a minimum tensile strength of 120,000 psi, a minimum Rockwell hardness of C25, and meet SAE J429. They have a zinc yellow-chromate plating and are marked on the head with three radial lines to indicate Grade 5.

Low-Strength Steel—Bolts have a minimum tensile strength of 60,000 psi, and a minimum Rockwell hardness of B69. They meet ASTM A307 Grade A and are uncoated.

Medium-Strength Steel

Medium-Strength Steel—Grade 5

Cap Screw, Hex Nut, and Washer Assortments

High-strength zinc yellow-chromate plated steel cap screws, hex nuts, and washers are Grade 8 steel. Assortment comes in a compartmented metal box with lid chart.

Medium-strength zinc-plated steel cap screws, hex nuts, and washers are Grade 5 steel. They come in a compartmented metal box with lid chart, except the assortment with 315 cap screws comes in two metal boxes.

Stainless steel cap screws, hex nuts, and washers are 18-8 stainless steel. They come in a compartmented metal box with lid chart.

Metric high-strength steel cap screws are Class 10.9 steel, hex nuts are Class 10 steel, and lock washers are spring steel. Assortment comes in a compartmented metal box with lid chart.

Metric medium-strength zinc-plated steel and **metric medium-strength steel** cap screws are Class 8.8 steel, hex nuts are Class 8 steel, and lock washers are spring steel. 315 cap screw assortment comes in a plastic compartmented box. 765 cap screw assortments come in two compartmented boxes; one is plastic and one is metal.

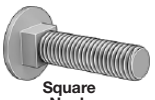
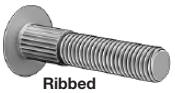
Carriage Bolts



Square Neck



Ribbed Neck

The neck shape keeps these bolts from turning when tightening a nut. The bolts have a smooth, rounded head and are fully threaded, unless noted. Length is measured from under the head. Stainless steel and galvanized steel bolts are a good choice for ACQ-treated (arsenic-free) lumber. Inch sizes have a Class 2A thread fit. Inch size square-neck bolts meet ANSI B18.5. Metric sizes have a Class 6g thread fit, except M6 bolts have a Class 8g thread fit.

Type 316 Stainless Steel—These are our most corrosion resistant carriage bolts.

18-8 Stainless Steel—More corrosion resistant than zinc-plated and hot-dipped galvanized steel bolts.

Zinc-Plated Steel—Offer good corrosion resistance. *Medium-strength steel (Grade 5)* meets SAE J429. *Low-strength steel (Grade 2)* meets ASTM A307 or SAE J429.

Hot-Dipped Galvanized Steel—These low-strength (Grade 2) steel bolts are more corrosion resistant than zinc-plated steel bolts. They meet ASTM A307; galvanization meets ASTM 153. Bolts must be used with the hot-dipped galvanized nuts on page 3208.

Bronze—These bolts are corrosion resistant and stand up to salt water. They are not rated for hardness.

Plow Bolts

Used on heavy equipment, these bolts are angled under the head to sit within countersunk holes. They conform to SAE J429 and have a Class 2A thread fit. Bolts have a smooth head and are partially threaded, unless noted. Length is measured from the top of the head.

No. 3 Square Neck with Flat Head— Bolts are zinc-plated Grade 5 medium-strength steel. The top of the head is marked with three radial lines to indicate Grade 5. Minimum tensile strength is 120,000 psi. Minimum Rockwell hardness is C25. Dimensions meet ASME B18.9.

No. 3 Square Neck with Dome Head— Bolts are zinc-plated Grade 8 high-strength steel. The top of the head is marked with six radial lines to indicate Grade 8. Minimum tensile strength is 150,000 psi. Minimum Rockwell hardness is C33.

No. 7 Key-Locking Neck with Flat Head— Also known as reverse-key plow screws and bucket-tooth bolts, these bolts have a single integral locking key that holds the bolt still as you tighten the nut. They're made from Grade 8 high-strength steel and the top of the head is marked with six radial lines to indicate Grade 8. Minimum tensile strength is 150,000 psi. Minimum Rockwell hardness is C33.

♣ Fully threaded.

Elevator Bolts

Nearly flush when installed, these low-profile bolts are used in tight spaces with moving parts, such as grain elevators and other belting systems. Bolts have a smooth head and are fully threaded, except fanged versions have an unthreaded shoulder. Length is measured from the top of the head. They have a minimum tensile strength of 74,000 psi and a minimum Rockwell hardness of B80. Inch sizes have a class 2A thread fit. Metric sizes have a Class 6g thread fit.

Square Neck— Bolts resist spinning when you tighten the nut. They're fully threaded.

Fanged— Sharp teeth hold tight so the bolts can't spin. They have an unthreaded shoulder.

Ribbed with Slotted Drive— Use with a heavy washer for a tight, vibration-free fit. Bolts are fully threaded. For 18-8 stainless steel washers, see 93852A on pages 3249-3250. For steel washers, see 90108A on page 3250.

T-Slot Bolts

The bolt head is designed to fit into the T-slot in your machine tool table. Length is measured from under the head.

Machined Neck—*Medium-strength steel* bolts are uncoated and have a minimum tensile strength of 100,000 psi, a minimum Rockwell hardness of C18, and a Class 3A thread fit. *High-strength steel* bolts have a black-oxide finish, a minimum tensile strength of 140,000 psi, a minimum Rockwell hardness of C32, and a Class 2A thread fit. *Metric high-strength steel* bolts are black Class 10.9 steel (which is comparable to Grade 8 steel) and meet DIN 787. They have a minimum tensile strength of 150,000 psi, a minimum Rockwell hardness of C32, and a Class 6g thread fit.

Round Neck—Also known as tugger bolts, they have a black-oxide finish and a Class 2A thread fit. *Medium-strength steel* bolts have a minimum tensile strength of 120,000 psi and a minimum Rockwell hardness of C25. *High-strength steel* bolts have a minimum tensile strength of 140,000 psi and a minimum Rockwell hardness of C32.

T-Slot Cleaner

Scrape debris out of T-slots. Cleaner is steel with a black-oxide finish. It is 6" long.

95379A214 ..... $2.57

T-Handle Bolts

A large T-handle provides a secure grip for steady tightening. These bolts are often called hold-down bolts, tank-strap bolts, and clamping pins. All have a Class 2A thread fit.

Without Collar—Commonly used with a band clamp or a tank strap to hold objects in place. These bolts have a minimum tensile strength of 120,000 psi and a minimum Rockwell hardness of C25.

With Collar—These bolts have a collar that slides along the shaft and can be welded in place to prevent over torquing. They have a black-oxide finish, a minimum tensile strength of 78,000 psi and a minimum Rockwell hardness of C45.

Without Collar—Medium-Strength Steel

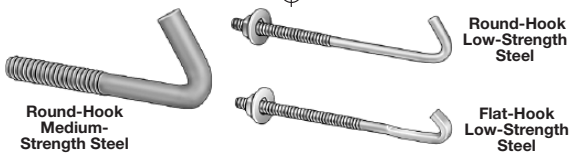
Hold-Down Bolts



Often used to hold batteries and sieve-shaker screens in place, the hook on these bolts grabs as the other end is tightened with a nut. All have a Class 2A thread fit.

Round-Hook Medium-Strength Steel—The steel is comparable to Grade 5 and meets SAE J429. Bolts have a minimum tensile strength of 120,000 psi and a minimum Rockwell hardness of C25.

Round- and Flat-Hook Low-Strength Steel—Bolts are zinc plated and come with a nut and washer. They have a minimum tensile strength of 60,000 psi and a minimum Rockwell hardness of B70.

Anchor Bolts

Designed for structural anchoring, these bolts are used to attach objects to concrete. All have a Class 2A thread fit and are not rated for hardness.

Uncoated Steel—Material meets ASTM A36. Bolts have a minimum tensile strength of 58,000 psi.

Hot-Dipped Galvanized Steel—Material meets ASTM A36. Bolts are thickly coated with zinc for excellent protection from rust and weather. Minimum tensile strength is 58,000 psi.

18-8 Stainless Steel—These bolts have superior corrosion resistance. Minimum tensile strength is 80,000 psi.

Hanger Bolts

Commonly used for wire guiding, hanging pipes and fixtures, and other tie-wire applications, hanger bolts have a flat end with a hole. They're made of zinc-plated or zinc yellow-chromate plated steel.

Toggle Bolt Hangers—A popular choice for overhead applications. **Toggle bolt hangers with spring** are easy to install because the spring holds the washer and toggle against opposite sides of the wall, so everything's in position before you begin tightening. Once tightened, the spring adds vibration resistance. They're not rated for hardness. **Toggle bolt hangers without spring** have a minimum Rockwell hardness of B68.

Eye Nut Hangers—Also known as eye couplings and tie-wire nuts, use these eye nut hangers on threaded rods, bolts, and anchors. Minimum Rockwell hardness is B68.

Wedge Anchor Hangers—Use in concrete and other solid materials. Hangers are not rated for hardness.

Machine Screw Hangers—Also known as spade bolts, you can use these versatile hangers in a threaded hole (as you would a screw), or secure them with a nut (as you would a bolt). Minimum Rockwell hardness is B68. All meet ASTM A307.

Drilling Screw Hangers—Use in up to 12-ga. steel. Install with the driver tool (sold separately). Driver tool has a 1/4″ hex shank. Hangers are not rated for hardness.

Wood Screw Hangers—Drive these into wood with an adjustable wrench, pliers, or the driver tool (sold separately). Driver tool has a 1/4″ hex shank. Hangers are not rated for hardness. 5/16″ thread size has a collar at the top of the threads.

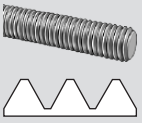
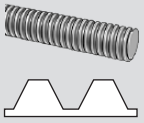
About Threaded Studs and Rods

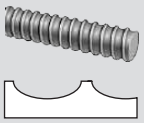
Fully Threaded



Threaded studs and rods (pages 3182-3198) with standard V-shaped threads are often used to anchor structural elements to surfaces, mount wheels and pulleys, and support fixtures in hanging systems. They can also be used as an alternative to a bolt.



Acme threaded studs and rods (pages 3202-3204) have threads that are broader, stronger, and more square than standard threads. Commonly found in vises and screw jacks, they carry heavy loads and are a good choice for applications that require fast threading.



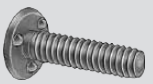
Coil-threaded rods (page 3198) have shallow threads that are spaced far apart for fast threading in applications that require quick assembly and disassembly. Often used in concrete forms, their thread design minimizes the accumulation of debris.

Partially Threaded

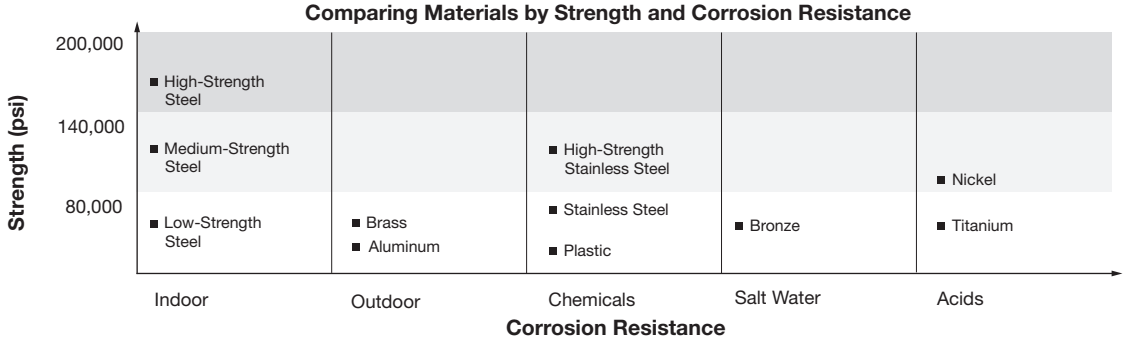
Adjusting and positioning studs (pages 3198-3200) have an unthreaded area in the middle that you can grip with a wrench.

Thread-adapting studs (page 3200) allow you to connect parts with different threads, such as coarse- to fine-threads, right-hand to left-hand threads, and wood screw to machine screw threads.

One-end-threaded studs (page 3200) have an unthreaded end that can be used as a pivot point, hinge, shaft, or locator pin.



Weld, perforated-base, and press-in studs (pages 3201-3202) allow you to permanently attach a stud to a flat surface.



High-Strength Steel Threaded Studs and Rods—Grade 8

With a minimum tensile strength of 150,000 psi, these uncoated studs and rods are 20% stronger than medium-strength Grade B7 steel. They have a minimum Rockwell hardness of C33. All have a Class 2A thread fit. 3/8″-16 and larger sizes meet ASTM A354BD.

Medium-Strength Steel Threaded Studs and Rods—ASTM A193 Grade B7

Comparable in strength to Grade 5 steel, these studs and rods have a minimum tensile strength of 125,000 psi and a maximum Rockwell hardness of C35. All have a Class 2A thread fit.

Uncoated studs and rods have a dark surface color. **Zinc yellow-chromate plated** studs and rods have better corrosion resistance than black oxide studs and rods and can be used outdoors. **Black oxide** studs and rods have a dark surface color and are mildly corrosion resistant. **Seize-resistant blue PTFE-coated** studs and rods have a coating that lubricates threads to keep nuts from sticking and provides corrosion resistance in harsh environments.

Medium-Strength Steel Threaded Studs and Rods—ASTM A193 Grade B7

(Continued from previous page)

Comparable in strength to Grade 5 steel, these studs and rods have a minimum tensile strength of 125,000 psi and a maximum Rockwell hardness of C35. All have a Class 2A thread fit.

Uncoated studs and rods have a dark surface color. **Zinc yellow-chromate plated** studs and rods have better corrosion resistance than black oxide studs and rods and can be used outdoors. **Black oxide** studs and rods have a dark surface color and are mildly corrosion resistant. **Seize-resistant blue PTFE-coated** studs and rods have a coating that lubricates threads to keep nuts from sticking and provides corrosion resistance in harsh environments.

Medium-Strength Steel Threaded Studs and Rods for High-Pressure and High-Temperature Applications—ASTM A193 Grade B16

Often used to secure pressure tanks, valves, and flanges, these studs and rods meet the pressure and temperature requirements of ASTM A193 Grade B16. Minimum tensile strength is 125,000 psi and maximum Rockwell hardness is C35. All have a Class 2A thread fit.

Low-Strength Steel Threaded Studs and Rods

Use these economical studs and rods for light duty applications. They have a minimum tensile strength of 53,000 psi and a minimum Rockwell hardness of B61. All have a Class 1A thread fit.

Uncoated studs and rods have a dark surface color.

Zinc-plated studs and rods are corrosion resistant and can be used outdoors.

Hot-dipped galvanized studs and rods are more corrosion resistant than zinc-plated studs and rods; they must be used with hot-dipped galvanized nuts for a correct thread fit (see page 3208).

Uncoated

(Continued on following page)

Low-Strength Steel Threaded Studs and Rods *(Continued from previous page)*

Use these economical studs and rods for light duty applications. They have a minimum tensile strength of 53,000 psi and a minimum Rockwell hardness of B61. All have a Class 1A thread fit.

Uncoated studs and rods have a dark surface color.

Zinc-plated studs and rods are corrosion resistant and can be used outdoors.

Hot-dipped galvanized studs and rods are more corrosion resistant than zinc-plated studs and rods; they must be used with hot-dipped galvanized nuts for a correct thread fit (see page 3208).

Metric Extreme-Strength Steel Threaded Rods—Class 12.9

The strongest threaded rods we offer, these uncoated steel rods are stronger than Grade 8 steel. They have a minimum tensile strength of 175,000 psi and a minimum Rockwell hardness of C39. Rods meet DIN 975. All have a 6g thread fit.

For information about threaded studs and rods, see page 3182.

Metric Medium-Strength Steel Threaded Studs and Rods—ASTM A193 Grade B7

Comparable in strength to Grade 5 steel, these studs and rods meet the pressure and temperature requirements of ASTM A193 and are often used to secure pressure tanks, valves, and flanges. Minimum tensile strength is 124,000 psi and maximum Rockwell hardness is C35. All have a 6g thread fit.

Uncoated studs and rods have a dark surface color.

Zinc yellow-chromate plated studs and rods are corrosion resistant and can be used outdoors.

Metric Medium-Strength Steel Threaded Studs and Rods—Class 8.8

An economical alternative to Grade B7 steel, these studs and rods have a minimum tensile strength of 115,000 psi and a minimum Rockwell hardness of C20. All have a 6g thread fit and meet DIN 975.

Uncoated studs and rods have a dark surface color.

Zinc-plated studs and rods are corrosion resistant and can be used outdoors.

Uncoated

For information about threaded studs and rods, see page 3182.

Stainless Steel Threaded Studs and Rods

Offering excellent resistance to chemicals and solvents, stainless steel studs and rods stand up to harsh environments. They may be mildly magnetic.

316 stainless steel studs and rods are more corrosion resistant than 18-8 stainless steel and can be used in saltwater environments. They have a minimum tensile strength of 70,000 psi and a minimum Rockwell hardness of B70. All have a Class 2A thread fit.

18-8 stainless steel studs and rods have a minimum tensile strength of 70,000 psi and a minimum Rockwell hardness of B70. All have a Class 1A thread fit.

Seize-resistant black-oxide coated 18-8 stainless steel rods have a finish that lubricates the threads to keep nuts from seizing or galling. Minimum tensile strength is 75,000 psi. They are not rated for hardness. All have a Class 1A thread fit.

Acid-resistant Alloy 20 stainless steel studs and rods contain nickel to withstand exposure to sulfuric, phosphoric, and nitric acids. Also known as Carpenter 20, they resist cracking from stress and corrosion. Minimum tensile strength is 80,000 psi. They are not rated for hardness. All meet ASTM B473.

316 Stainless Steel

Stainless Steel Threaded Studs and Rods *(Continued from previous page)*

Offering excellent resistance to chemicals and solvents, stainless steel studs and rods stand up to harsh environments. They may be mildly magnetic.

316 stainless steel studs and rods are more corrosion resistant than 18-8 stainless steel and can be used in saltwater environments. They have a minimum tensile strength of 70,000 psi and a minimum Rockwell hardness of B70. All have a Class 2A thread fit.

18-8 stainless steel studs and rods have a minimum tensile strength of 70,000 psi and a minimum Rockwell hardness of B70. All have a Class 1A thread fit.

Seize-resistant black-oxide coated 18-8 stainless steel rods have a finish that lubricates the threads to keep nuts from seizing or galling. Minimum tensile strength is 75,000 psi. They are not rated for hardness. All have a Class 1A thread fit.

Acid-resistant Alloy 20 stainless steel studs and rods contain nickel to withstand exposure to sulfuric, phosphoric, and nitric acids. Also known as Carpenter 20, they resist cracking from stress and corrosion. Minimum tensile strength is 80,000 psi. They are not rated for hardness. All meet ASTM B473.

316 Stainless Steel (Cont.)

For information about threaded studs and rods, see page 3182.

Stainless Steel Threaded Studs and Rods for High-Pressure and High-Temperature Applications—ASTM A193

Used for bolting applications in pressure tanks, valves, and flanges, these stainless steel studs and rods meet the pressure and temperature requirements of ASTM A193. Stainless steel provides excellent corrosion resistance to solvents and chemicals. All have a Class 2A thread fit. They may be mildly magnetic.

High-strength 316 stainless steel studs and rods have a minimum tensile strength of 100,000 psi and a maximum Rockwell hardness of C35. They are more corrosion resistant than 410 stainless steel. All meet ASTM A193 Grade B8M.

High-strength 410 stainless steel rods are stronger than 316 stainless steel. Minimum tensile strength is 110,000 psi. They're comparable in corrosion resistance to 18-8 stainless steel. All meet ASTM A193 Grade B6. Not rated for hardness.

316 and **18-8 stainless steel** studs and rods have a minimum tensile strength of 75,000 psi and a maximum Rockwell hardness of B96. *316 stainless steel* meets ASTM A193 Grade B8M. *18-8 stainless steel* meets ASTM A193 Grade B8.

Metric Stainless Steel Threaded Studs and Rods

Resistant to chemicals and solvents, these stainless steel studs and rods stand up to harsh environments. Minimum tensile strength is 70,000 psi. They are not rated for hardness. All have a 6g thread fit and meet DIN 976. They may be mildly magnetic.

316 stainless steel studs and rods are suitable for saltwater environments and are more corrosion resistant than 18-8 stainless steel. **18-8 stainless steel** studs and rods are corrosion resistant.

Nickel Threaded Rods

More corrosion resistant than stainless steel, these rods resist cracking from stress and corrosion in the harshest acidic and saltwater environments. Minimum tensile strength is 80,000 psi. All have a class 2A thread fit. Rods may be mildly magnetic.

Nickel-Copper 400 (also known as Monel) rods have excellent resistance to corrosion in caustic conditions. These rods are commonly used in valves, pumps, and shafts.

Hastelloy C276 rods are suitable for welding and chemical processing. They're resistant to pitting and cracking from exposure to formic and acetic acids, brine solutions, and corrosive chemicals such as chlorine.

Aluminum Threaded Studs and Rods

One-third the weight and more corrosion resistant than zinc-plated steel, aluminum threaded studs and rods are a good choice for outdoor applications. Minimum tensile strength is 42,000 psi and minimum Rockwell hardness is B40. All have a Class 1A thread fit.

Titanium Threaded Rods

These Grade 2 titanium rods are known for their superior corrosion resistance to acids and salt water and high strength-to-weight ratio. They're 40% lighter than steel. Material is nonmagnetic. Minimum tensile strength is 50,000 psi and minimum Rockwell hardness is B80. All rods have a Class 2A thread fit.

Brass and Bronze Threaded Studs and Rods

Choose brass and bronze studs and rods where corrosion resistance and electrical conductivity are needed. They're nonmagnetic. Inch sizes have a Class 1A thread fit. Metric sizes have a Class 6g thread fit.

Brass threaded studs and rods are comparable in corrosion resistance to aluminium. Minimum tensile strength is 50,000 psi and minimum Rockwell hardness is B55.

Bronze threaded studs and rods are more corrosion resistant than brass and stainless steel studs and rods. Minimum tensile strength is 55,000 psi. Not rated for hardness.

Plastic Threaded Studs and Rods

A lightweight and chemical-resistant alternative to metal, these plastic studs and rods are often used in corrosive environments. They're nonconductive, making them good for use around sensitive electrical components. Not rated for tensile strength or hardness.

General purpose nylon 6/6 studs and rods stand up to oils, greases, and solvents (except mineral acids). Nylon absorbs moisture, which can cause it to become brittle over time in wet environments. Maximum temperature is 185°F. Inch sizes have a Class 2A thread fit. Metric sizes have a Class 6g thread fit.

High-strength fiberglass rods are stronger than nylon rods. Not rated for temperature. All have a Class 1A thread fit.

Moisture-resistant acetal rods are less susceptible to dimensional changes than nylon studs and rods. They're resistant to alcohols, weak alkalies, and salt solutions. Maximum temperature is 180°F. All have a Class 2A thread fit.

Chemical-resistant PVC rods resist acids, alkalies, salt solutions, and alcohols. Maximum temperature is 130°F. All have a Class 2A thread fit.

Wear/chemical-resistant PTFE rods are abrasion resistant and stand up to oils, greases, detergents, and most mineral acids. Maximum temperature is 250°F. All have a Class 2A thread fit.

Coil-Threaded Rods, Bolts, and Nuts

Rod

Bolt

Hex Nut

Flange Nut

Wing Nut

Coil-style threads are shallow and widely spaced for fast threading and quick assembly. Their thread design minimizes the accumulation of dirt and debris. Components are often used in concrete forming systems. Not rated for hardness.

Rods are uncoated steel. They have a minimum tensile strength of 80,000 psi.

Bolts are made from uncoated steel. They have a minimum tensile strength of 80,000 psi. Length is measured from under the head.

Hex nuts are uncoated steel. Not rated for tensile strength.

Flange nuts have a large bearing surface to cover holes and resist vibration. They're made from uncoated iron. Not rated for tensile strength.

Wing nuts can be fastened by hand. They're uncoated iron. Not rated for tensile strength.

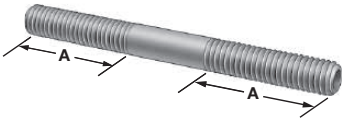
Hollow Studs



A hollow center allows these studs to be used as an axle, a vent, or a passageway for wiring. They're 18-8 stainless steel. Thread length is the same on both ends. Not rated for tensile strength. Rockwell hardness is B83. All have a Class 2A thread fit.

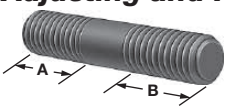
Adjusting and Positioning Studs



Also known as setup and driver studs, these studs are typically used in clamping and workholding applications. An unthreaded space in the middle can be used to make adjustments with a wrench. These studs are often used with setup clamps (see page 2602).

Black-oxide steel studs are mildly corrosion resistant. They have a minimum tensile strength of 125,000 psi and a minimum Rockwell hardness of C22. Inch sizes have a Class 2A thread fit. Metric sizes have a Class 6g thread fit. Inch size studs with a thread size larger than 3/8"-16 and longer than 3" with equal (A) and (B) thread lengths have a shank with flat sides, making them easier to grip with a wrench.

18-8 stainless steel studs are chemical resistant. Minimum tensile strength is 85,000 psi and minimum Rockwell hardness is B83. All have a Class 2A thread fit.

Metric uncoated steel studs are Class 8.8 steel. They have a minimum tensile strength of 116,000 psi and a minimum Rockwell hardness of C22. All have a Class 6g thread fit.

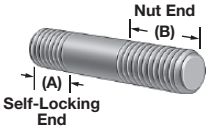
Thread-Locking Adjusting and Positioning Studs



Often referred to as milled and tap-end studs, one end has self-locking, friction-fit threads and the other end has machine screw threads that are designed to accept a nut. Screw the friction-fit threaded end into a tapped hole with a standard thread fit to keep the stud securely in place as you fasten objects to it. Studs can be removed and reused. For inch sizes, the machine-threaded nut end has a Class 2A thread fit and the self-locking end has a Class 5 thread fit. Metric sizes have a Class 6g thread fit on the machine-threaded end and Class SK6 on the self-locking end.

Low-strength uncoated steel studs have a minimum tensile strength of 65,000 psi. They're not rated for hardness. **18-8 stainless steel** studs are chemical resistant. They may be mildly magnetic. Minimum tensile strength is 85,000 psi. They're not rated for hardness. **Metric medium-strength uncoated steel** studs have a minimum tensile strength of 120,000 psi and a minimum Rockwell hardness of C20.

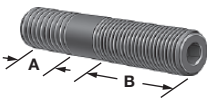
Coarse- to Fine-Thread Adapting Studs



Connect parts with coarse threads to parts with fine threads. Studs are high-strength black-oxide steel and mildly corrosion resistant. Minimum tensile strength is 150,000 psi and minimum Rockwell hardness is C38. All have a Class 3A thread fit. For other thread adapters, see pages 3302-3304.

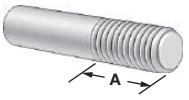
One-End-Threaded Studs



Screw these studs into a tapped hole and use them as a pivot point, hinge, shaft, or locator pin. Made from 18-8 stainless steel, they're chemical resistant and may be mildly magnetic. Minimum tensile strength is 70,000 psi. Not rated for hardness. All have a Class 2A thread fit.

Right- to Left-Hand Thread Adapting Studs

Fasten parts with right-hand threads to parts with left-hand threads. Thread length is the same on both ends. Studs are black-oxide steel, making them mildly corrosion resistant. Minimum tensile strength is 70,000 psi and minimum Rockwell hardness is B67. All have a Class 2A thread fit.

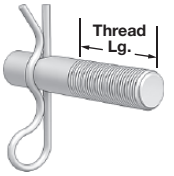
One-End-Threaded Studs with Cotter Pin



Also known as hood pins, these studs have a cotter pin lodged through a drilled hole in the unthreaded portion. The cotter pin can be used for light duty holding, such as securing access panels and locking other fasteners. Stud and cotter pin are 18-8 stainless steel, making them chemical resistant and mildly magnetic. Not rated for tensile strength. Minimum Rockwell hardness is B89. All have a Class 2A thread fit.

For information about threaded studs and rods, see page 3182.

Threaded Studs for Wood

Wood Screw to Wood Screw—Also known as dowel screws, these studs can be used to join two pieces of wood. They're low-strength uncoated steel. Not rated for tensile strength. All have a minimum Rockwell hardness of B80.

Wood Screw to Machine Screw—These studs can be used to suspend electrical wiring from wood structures. Not rated for tensile strength or hardness. For threaded stud drivers, see page 2829. **Zinc-plated steel** studs are low-strength and mildly corrosion resistant. Machine screw threads have a Class 1A thread fit. **18-8 stainless steel** studs are chemical resistant. They may be mildly magnetic. Machine screw threads have a Class 1A thread fit. **Metric 316 stainless steel** studs stand up to chemicals better than 18-8 and may be mildly magnetic. Machine screw threads have a Class 6g thread fit.

Perforated Base Studs

Securely anchor components by screwing, riveting, or bonding these studs to a flat surface. Perforations are 0.157" and 0.197". Thread fit is Class 2A. Not rated for tensile strength or hardness. **Zinc-plated steel** studs are 1008 carbon steel. They're mildly corrosion resistant. **316 stainless steel** studs are chemical resistant. They may be mildly magnetic.

Press these studs into a drilled or punched hole with an arbor press or similar tool. Also known as self-clinching studs, their ribs hold the stud firmly in place. They're not rated for tensile strength or hardness. All have a Class 2A thread fit.

Zinc-plated steel studs are mildly corrosion resistant.

18-8 stainless steel studs are more corrosion resistant than zinc-plated studs. They may be mildly magnetic.

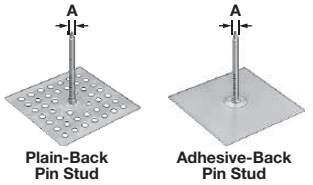
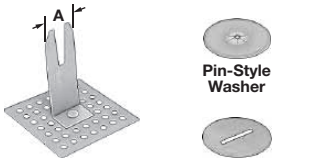
Insulation Hanger Studs



Plain-Back Pin Stud | Adhesive-Back Pin Stud



Plain-Back Slot Stud | Pin-Style Washer | Slot-Style Washer

Attach these hanger studs to a flat surface, press insulation onto spikes, then secure by sliding washers over the spikes. All components are low-strength steel. Studs and washers are sold separately.

Plain-back studs can be installed using adhesive (sold separately).

Adhesive-back studs have a peel-off adhesive liner. Adhesive temperature range is 0° to 140° F.

Adhesive is formulated for holding insulation hanger studs and can be used on uncoated metal, concrete, and masonry surfaces. Temperature range is –20° to 225° F, but it should be applied at temperatures above 40° F.

General Purpose Acme Threaded Studs and Rods

With broad and square threads, general purpose Acme threaded studs and rods are well suited for carrying heavy loads. They're often found in applications that require fast threading and frequent adjustments, such as vises and screw jacks. Their widely spaced threads minimize the accumulation of dirt and debris. For precision Acme rods, see pages 1155 and 1157.

Medium-strength uncoated steel studs and rods are Grade B7 steel that meets ASTM A193. They have a minimum tensile strength of 125,000 psi and a maximum Rockwell hardness of C35.

Low-strength uncoated steel studs and rods meet ASTM A108. Similar in strength to Grade 2 steel, they have a minimum tensile strength of 53,000 psi and a minimum Rockwell hardness of B61. *Zinc-plated low-strength steel* studs and rods are mildly corrosion resistant.

316 stainless steel studs and rods are the most corrosion resistant Acme studs and rods we offer. They meet ASTM A193. Minimum tensile strength is 75,000 psi and maximum Rockwell hardness is B97.

18-8 stainless steel studs and rods are chemical resistant. Maximum Rockwell hardness is B96. They're not rated for tensile strength.

General Purpose Acme Threaded Studs and Rods *(Continued from previous page)*

With broad and square threads, general purpose Acme threaded studs and rods are well suited for carrying heavy loads. They're often found in applications that require fast threading and frequent adjustments, such as vises and screw jacks. Their widely spaced threads minimize the accumulation of dirt and debris. For precision Acme rods, see pages 1155 and 1157.

Medium-strength uncoated steel studs and rods are Grade B7 steel that meets ASTM A193. They have a minimum tensile strength of 125,000 psi and a maximum Rockwell hardness of C35.

Low-strength uncoated steel studs and rods meet ASTM A108. Similar in strength to Grade 2 steel, they have a minimum tensile strength of 53,000 psi and a minimum Rockwell hardness of B61.

Rod

Hex Nut

Rods are black-oxide steel that meets ASTM A108. They're mildly corrosion resistant. Not rated for tensile strength. Rockwell hardness is B72. Thread fit is Class 7E.

Nuts are uncoated steel. They're not rated for tensile strength. All have a Class 7H thread fit.

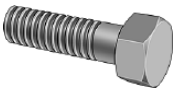
General Purpose Acme Threaded Bolts



Made from uncoated medium-strength Grade 5 steel, these Acme threaded bolts have a minimum tensile strength of 105,000 psi and a minimum Rockwell hardness of C19. Length is measured from under the head. They're partially threaded.

General Purpose Acme Hex Nuts

Secure general purpose Acme threaded studs, rods, and bolts with these hex nuts. They're not rated for tensile strength. All have a Class 2G thread fit.

Steel nuts are uncoated low-strength steel.

Plated steel nuts are zinc plated for corrosion resistance.

Brass nuts have good corrosion resistance and can be used outdoors. They're made from brass that meets ASTM B16.

18-8 stainless steel nuts are chemical resistant. They may be mildly magnetic.

General Purpose Acme Coupling Nuts

Join two lengths of general purpose Acme studs and rods. Not rated for tensile strength. All have a Class 2G thread fit.

Uncoated steel coupling nuts are low-strength steel.

18-8 stainless steel coupling nuts are chemical resistant. They may be mildly magnetic.

General Purpose Acme Cylinder Nuts

These nuts are often used to connect as well as space Acme threaded components. They're not rated for tensile strength. All have a Class 2G thread fit.

Gray iron nuts are good for general purpose, low-strength applications.

Bronze nuts meet ASTM B505, Grade 932. They're more corrosion resistant to salt water and chemicals than iron and brass nuts.

Brass nuts are made from material that meets ASTM B16. They're corrosion resistant to outdoor elements.

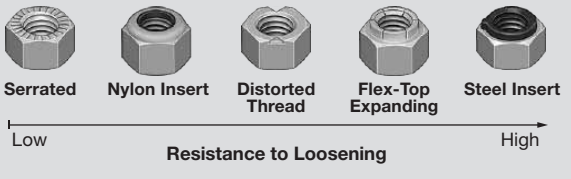
About Nuts, Materials, and Finishes

Types of Nuts

Hex nuts (pages 3207-3218)

Locknuts (pages 3220-3227) have a locking feature to resist loosening under vibration.



Flange nuts (pages 3225-3227) distribute holding pressure and reduce stress where the nut meets the material surface. Their wide base eliminates the need for a separate washer.

Cap nuts (pages 3228-3230) cover and protect threads while adding a finished appearance.

Square nuts (page 3219) have large sides, which makes them easier to grip with a wrench and keeps them from rotating in channels and square holes.

Thumb and wing nuts (pages 3230-3232) can be tightened or loosened by hand. They're often used in applications that require frequent adjustments.

Quick-threading nuts (page 3233) slide smoothly onto threads for quick installation and easy adjustments.

Coupling nuts (pages 3234-3235) are used to connect or extend threaded rod. They're about three-times taller than standard hex nuts.

Tamper-resistant nuts (page 3236) have hard-to-grip uncommon drive styles to reduce the risk of theft and tampering.

Press-in nuts (page 3237) add threads to thin metal or plastic panels. Install using an arbor press or similar pressure tool. Knurls hold the nut in place.

Weld nuts (pages 3240-3241) add threads to metal surfaces.

Comparing Materials by Strength

■Plastic ■Low-Strength Steel ■18-8/316 Stainless Steel ■Medium-Strength Steel ■High-Strength Steel ■Extreme-Strength Steel
■Ceramic ■Brass ■Nickel
■Aluminum ■Titanium ■Bronze ■410 Stainless Steel ■17-4 PH Stainless Steel

Low → High

Comparing Coatings and Finishes by Corrosion Resistance

■Black Oxide ■Zinc Plated ■Galvanized ■Cadmium Plated ■Black Luster Coated ■Nickel Plated ■Zinc Aluminum Coated

Indoor → Outdoor → Chemicals → Salt Water → Acids

Poor → **Excellent**

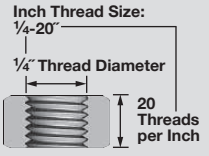
Choosing a Compatible Nut Grade

Match your screw, bolt, or threaded rod with a comparable strength nut.

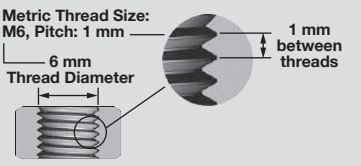
	Screw/Bolt/Rod Grade	Hex Nut Grade	Extra-Wide Hex Nut Grade	Locknut Grade
Steel—Inch Sizes				
Extreme Strength	Grade 9	Grade 9	Grade 2H	Grade 9
High Strength	Grade 8	Grade 8	Grade C	Grade G
Medium Strength	Grade 5	Grade 5	Grade 5	Grade F
Low Strength	Grade 2/Not graded	Grade 2/Not graded	Grade 2/Not graded	Grade 2/Not graded
Steel—Metric Sizes				
Extreme Strength	Class 12.9	Class 12	Grade 2H	Class 12
High Strength	Class 10.9	Class 10	Class 10	Class 10
Medium Strength	Class 8.8	Class 8	Class 8	Class 8
Low Strength	Class 4.6/Class 5.8/ Not graded	Class 4/Class 5/Class 6/ Not graded	Class 4/Class 5/Class 6/ Not graded	Class 4/Class 5/Class 6/ Not graded

Understanding Thread Size

Inch sizes are specified by the diameter of the opening and threads per inch. For those with a diameter smaller than ¼", diameter is indicated by a number (e.g., #1 or No. 1).



Metric sizes are specified by diameter of the opening and pitch.



Hex Nuts

Use these hex nuts for general purpose fastening applications. Nuts with 1/4" screw size and larger are known as full or finished hex nuts. Nuts with screw sizes of 0000 to 12 are known as machine screw nuts. Thread fit is Class 2B, except brass nuts with a screw size smaller than 0 are not rated for thread fit.

Hot-dipped galvanized nuts must be used with other hot-dipped galvanized fasteners for a correct thread fit.

(Continued on following page)

Hex Nuts *(Continued from previous page)*

Use these hex nuts for general purpose fastening applications. Nuts with 1/4" screw size and larger are known as full or finished hex nuts. Nuts with screw sizes of 0000 to 12 are known as machine screw nuts. Thread fit is Class 2B, except brass nuts with a screw size smaller than 0 are not rated for thread fit. For nut widths and heights, see the table at the top of page 3207.

Hot-dipped galvanized nuts must be used with other hot-dipped galvanized fasteners for a correct thread fit.

Zinc Yellow-Chromate Plated High-Strength Grade 8 Steel Nuts with Material Test Report

These nuts come with a traceable lot number and a physical and chemical test report. Prices are approximately 30% more than the equivalent sizes in standard zinc yellow-chromate plated high-strength Grade 8 steel (see page 3207).

Choose a Thread Size

Hex Nut Assortments

All assortments come in a compartmented plastic case. Inch assortments include nuts that have a Class 2B thread fit. Metric assortments include nuts with a Class 6H thread fit that meet DIN 934.

	Thread Sizes Included	No. of Nuts

Mil. Spec. Hex Nuts

Choose these nuts for their excellent corrosion resistance and adherence to strict military standards for material and construction. They meet FF-N-836. All nuts have a Class 2B thread fit.

300 series stainless steel hex nuts are passivated for superior corrosion resistance. They meet QQ-P-35.

Sealing Hex Nuts

A silicone O-ring prevents leaks, seals out contaminants, and provides vibration resistance. The O-ring maintains a seal at pressures up to 6,000 psi and has a temperature range of –100° to 400° F. These hex nuts are reusable. All have a Class 2B thread fit. They meet UL 50 for use on enclosures.

Plastic Hex Nuts

Often used in corrosive environments, plastic hex nuts are a lightweight and nonconductive alternative to metal hex nuts. Inch sizes have a Class 2B thread fit. Metric sizes have a Class 6H thread fit.

Nylon 6/6 nuts resist oils, greases, and solvents(except mineral acids). Nylon 6/6 absorbs moisture, which can cause it to become brittle over time in wet environments. Temperature range is –40° to 185° F.

Glass-filled nylon nuts are stronger than nylon 6/6 nuts. They resist oils, greases, and solvents (except mineral acids). Temperature range is –40° to 230° F.

Fiberglass nuts are stronger than nylon nuts. They resist acids, solvents, salt water, and oils. Maximum temperature is 190° F.

Acetal nuts resist alcohols, gasoline, and solvents. They're not rated for temperature.

Polycarbonate nuts have excellent impact resistance. They stand up to oils, greases, and detergents. Not rated for temperature.

PVC nuts resist acids, alkalies, salt solutions, and alcohols. Not rated for temperature.

Polypropylene nuts resist organic solvents and degreasing agents. Temperature range is –20° to 212° F.

PTFE nuts are the lowest friction plastic we offer, so they thread on smoothly. They stand up to oils, greases, detergents, and most mineral acids. Maximum temperature is 500° F.

PEEK nuts have excellent electrical insulation properties. They resist acids, bases, and salt solutions. Maximum temperature is 550° F.

Thin Hex Nuts

Also known as half-height nuts and jam nuts, these hex nuts are thinner than standard hex nuts. Use them in tight spaces or jam one against another nut to lock it in place. All have a Class 2B thread fit.

Thin Hex Nuts *(Continued from previous page)*

Also known as half-height nuts and jam nuts, these hex nuts are thinner than standard hex nuts. Use them in tight spaces or jam one against another nut to lock it in place. All have a Class 2B thread fit.

For nut widths and heights, please see the table at the top of page 3213.

Mil. Spec. Thin Hex Nuts

Adhering to strict military standards for material and construction, these nuts meet MS 35691 and FF-N-836 specifications. They're 300 series stainless steel and have excellent corrosion resistance. Also known as half-height nuts and jam nuts, they're thinner than standard hex nuts. Use them in tight spaces or jam one against another nut to lock it in place. All have a Class 2B thread fit.

Metric Thin Hex Nuts—DIN 439B

Thinner than standard metric hex nuts, use these hex nuts in tight spaces or jam one against another nut to lock it in place. They're often referred to as jam nuts or half-height nuts. All have a Class 6H thread fit.

Extra-Wide Hex Nuts

Often referred to as heavy hex nuts, these nuts are about 10% wider and taller than standard hex nuts. They distribute the load over a large area for a strong and secure hold. All have a Class 2B thread fit.

Hot-dipped galvanized nuts must be used with other hot-dipped galvanized fasteners for a correct thread fit.

Hex Nuts for ASTM A325 Structural Bolts

These high-strength nuts are designed to secure ASTM A325 bolts in structural joints. They meet ASTM A563. About 10% wider and taller than standard hex nuts, they distribute the load over a large area for a strong and secure hold. All have a Class 2B thread fit.

Hot-dipped galvanized nuts must be used with other hot-dipped galvanized fasteners for a correct thread fit.

Hex Nuts for ASTM A193 High-Pressure Bolts

Able to maintain their strength in high-pressure and high-temperature environments, these nuts are often used to fasten pressure tanks, valves, and flanges. They meet ASTM A194. They're about 10% wider and taller than standard hex nuts, except hardened high-pressure Grade 8M 316 stainless steel nuts. All have a Class 2B thread fit.

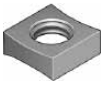
Concave Square Locknuts



Also known as utility-pole nuts, these locknuts have corners that bite into soft materials to hold securely. Their cupped shape ensures a flush fit against curved surfaces. Made from hot-dipped galvanized steel, they must be used with other hot-dipped galvanized fasteners for a correct thread fit.

Extra-Wide Thin Hex Nuts

Use these nuts for added strength in tight spaces. Also known as heavy jam nuts or heavy half-height nuts, jam one of these nuts against another extra-wide nut to prevent loosening. All have a Class 2B thread fit.

High Hex Nuts

With a height that is 50% taller than standard hex nuts, high hex nuts offer more wrench clearance. They're a good choice for spaces with limited driver access. Inch sizes have a Class 2B thread fit. Metric sizes have a Class 6H thread fit.

Mil. Spec. Narrow Hex Nuts

Passivated for corrosion resistance, these 300 series stainless steel nuts are made to stringent military standards for material and construction. They meet NAS671C and FF-N-836. Use these nuts in tight spaces where standard hex nuts won't fit. All have a Class 3B thread fit.

Narrow Hex Nuts

Also known as small-pattern nuts and undersized machine screw nuts, these nuts are often used in tight spaces where standard hex nuts won't fit. They're about 20% narrower than standard hex nuts. Thread fit is Class 2B, except brass nuts with a thread size of 0-80 and 1-72 are not rated for thread fit.

Hex Nuts with Lock Washer

Often referred to as Keps or K-lock nuts, these nuts have a free-spinning lock washer to resist loosening once fastened. Inch sizes have a Class 2B thread fit. Metric sizes have a Class 6H thread fit.

Nuts with tooth washer have teeth that bite into the surface when tightened.

Nuts with conical washer have a smooth rim that's less likely to scratch materials when tightened.

Assortments with Tooth Washer

These assortments include nuts with tooth washers that bite into surfaces to resist loosening. All nuts have a Class 2B thread fit. They come in a plastic case with lid chart.

	No. of Nuts	Thread Sizes Included		
Zinc-Plated Low-Strength Steel	600	4-40, 6-32, 8-32, 10-24, 10-32, 1/4"-20	90740A106	$75.62
18-8 Stainless Steel	600	4-40, 6-32, 8-32, 10-24, 10-32, 1/4"-20	90625A500	99.58

Square Nuts

With a large bearing surface, these square nuts allow you to get a more secure grip while tightening than standard hex nuts. They're often inserted into channels and square holes to keep from turning. Inch sizes have a Class 2B thread fit. Metric sizes have a Class 7H thread fit and meet DIN 557.

Hot-dipped galvanized nuts must be used with other hot-dipped galvanized fasteners for a correct thread fit.

Nylon-Insert Locknuts

A nylon insert grips threads to resist loosening. Also known as elastic stop nuts, these can be used as a stop or a spacer for rotating parts. Nuts can be removed without damaging threads. They're reusable (unless noted), but their holding power lessens with each use. Nylon absorbs moisture, which can cause the insert to become brittle over time in wet environments. Maximum temperature of the insert is 225° F, unless noted. All locknuts have a Class 2B thread fit.

Metric Nylon-Insert Locknuts

These metric locknuts have a nylon insert that grips threads to resist loosening. Also known as elastic stop nuts, they can be used as a stop or a spacer for rotating parts. Nuts can be removed without damaging threads. They're reusable, but their holding power lessens with each use. Nylon absorbs moisture, which can cause the insert to become brittle over time in wet environments. Maximum temperature of the insert is 220° F. All locknuts have a Class 6H thread fit. They meet DIN 985, unless noted.

Thin Nylon-Insert Locknuts

Thinner than standard nylon-insert locknuts, these nuts can be used in tight spaces where clearance is limited. The nylon-insert grips threads to resist loosening. Nuts can be removed without damaging threads. They're reusable (unless noted), but their holding power lessens with each use. Nylon absorbs moisture, which can cause the insert to become brittle over time in wet environments. Maximum temperature of the insert is 220° F, unless noted. Thread fit is Class 2B, unless noted.

■ Not reusable; not rated for temperature. ♣ Thread fit is Class 3B.

Extra-Wide Nylon-Insert Locknuts

Wider and taller than standard nylon-insert locknuts, these nuts distribute the load over a large area for added holding strength. They have a nylon insert that grips threads to resist loosening. Also known as elastic stop nuts, these can be used as a stop or a spacer for rotating parts. Nuts can be removed without damaging threads. They're reusable (unless noted), but their holding power lessens with each use. Nylon absorbs moisture, which can cause the insert to become brittle over time in wet environments. Maximum temperature of the insert is 250° F, unless noted. All locknuts have a Class 2B thread fit.

Extra-Wide Thin Nylon-Insert Locknuts

Use these nuts in tight spaces where added strength is required. The nylon insert grips threads for a secure hold. Also known as elastic stop nuts, they can be used as a stop or a spacer for rotating parts. Nuts can be removed without damaging threads. They're reusable, but their holding power lessens with each use. Nylon absorbs moisture, which can cause the insert to become brittle over time in wet environments. Maximum temperature of the insert is 250° F. Thread fit is Class 2B, except 18-8 stainless steel locknuts have a Class 3B thread fit.

Nylon Flange Nuts

Partially tapped with a locking thread, these nuts form threads as they're tightened. Made from white nylon 6/6, they absorb moisture, which can cause them to become brittle over time in wet environments. Nuts are reusable, but holding power lessens with each use. Temperature range is –40° to 185° F.

Two-Piece Thread-Clamping Locknuts for Extreme Vibration

Also known as drake style nuts, these two-piece locknuts are more vibration-resistant than flex-top expanding locknuts. To use, fasten the slotted nut, then tighten the concave jam nut on top of it. The slotted nut's flexible top expands while the jam nut clamps the slots back onto the bolt for a secure hold. Made from uncoated steel, they're for use with medium-strength Grade 5 and B7 steel bolts and studs. They're reusable. Thread fit is Class 2B.

Steel-Insert Locknuts for Extreme Vibration

Stronger with a more secure grip than nylon-insert style and distorted-thread locknuts, these nuts are often used to secure parts on machines exposed to extreme vibration, such as shakers and vibrating conveyor systems. They're reusable up to 50 times. The strength of the bolt, screw, rod, or stud should match the strength of the nut to prevent damaging threads. Inch sizes have a Class 2B thread fit. Metric sizes have a Class 6H thread fit.

Flex-Top Expanding Locknuts for Extreme Vibration

Also known as Flexloc and split-beam nuts, these one-piece nuts have a slotted top that expands when tightened. They're often used to secure parts in engines and suspension systems. **Cadmium-plated steel** nuts are reusable up to 15 times; **18-8 stainless steel** nuts are not reusable. The strength of the bolt, screw, rod, or stud should match the strength of the nut to prevent damaging threads. Inch sizes have a Class 2B thread fit. Metric sizes have a Class 6H thread fit.

Mil. Spec. Flex-Top Expanding Locknuts for Extreme Vibration

Choose these locknuts for their excellent corrosion resistance and adherence to strict military standards for material and construction. They have a slotted top that expands to grip threads. Also known as all-metal, Flexloc, and split-beam nuts, they're often used to secure parts in engines and suspension systems. They're reusable up to 10 times. All have a Class 3B thread fit.

Silver-plated 300 series stainless steel locknuts have a silver plating that lubricates threads for smooth threading.

Distorted-Thread Locknuts

Toplock Grade 9 Steel

Toplock

Centerlock

Providing a moderately stronger hold than nylon-insert style locknuts, these nuts have a section of distorted threads that keep them securely fastened. Indentations on the nut body indicate where threads are distorted. They're not reusable. Inch sizes have a Class 2B thread fit. Metric sizes meet DIN 980V and have a Class 6H thread fit.

Toplock nuts, also known as Stover locknuts, have deformed threads at the top of the nut. They're often referred to as one-way locknuts because they must be threaded on from the bottom of the nut. **Centerlock** nuts have deformed threads in the middle of the nut. Also known as two-way locknuts, they can be threaded on from either end.

Flanged Distorted-Thread Locknuts

A wide flange distributes holding pressure and a distorted thread tightly grips threads to keep these nuts securely fastened.
Black phosphate high-strength Grade G steel locknuts have a Class 2B thread fit. They're not reusable.
Mil. Spec. locknuts meet stringent military specifications for material and construction and have excellent corrosion resistance. All have a Class 3B thread fit. They can be reused up to two times. *Silver-plated A286 super alloy* locknuts have a silver plating that lubricates threads for smooth threading.

Slotted Locknuts for use with Cotter Pins

Often referred to as castle nuts, these locknuts are for light duty locking applications. They're not recommended for use on parts exposed to high vibration, because the pin is prone to shearing under prolonged stress. To secure, insert a cotter pin or safety wire through a hole drilled through the screw, bolt, stud, or rod. They can be reused up to two times. Inch sizes have a Class 2B thread fit. Metric sizes have a Class 6H thread fit. For cotter pins, see page 3396-3397.

Safety Wire Locking Nut Retainers

Prevent nuts from working loose under vibration. Insert one of these retainers between a nut and the mating surface, then attach wire (sold separately) to lock the nut in place. Retainers are made from spring steel. Wire is stainless steel.
For wire twisting pliers, see page 2747.

Flange Nuts

These one-piece nuts have a smooth flange that distributes holding pressure and reduces stress where the nut meets the material surface. Also known as collar nuts, their wide base allows them to be used in place of a nut with a separate washer. Inch sizes have a Class 2B thread fit. Metric sizes have a Class 6H thread fit, except metric low-strength steel nuts have a Class 6G thread fit.

Leveling Flange Nuts

Also known as spherical collar nuts and self-aligning nuts, these nuts have a convex base that fits against a concave washer to allow secure clamping on slightly uneven surfaces. All have a Class 2B thread fit.

Thread Size	Flange Dia.	O'all Ht.	Max. Correction	Black-Oxide Steel	Each	18-8 Stainless Steel	Each

Rotating Flange Nuts

Protect your workpiece from damage and scratching by using these rotating flange nuts. The nut head rotates 360° while the attached washer remains stationary to resist marring delicate surfaces. The nut and flange are made from black-oxide steel. Thread fit is Class 2B.

Thread Size	Flange Dia.	O'all Ht.		Each
1/4"-20	5/8"	3/8"	90477A029	$3.68

1"-8	2"	1 15/64"	90477A038	13.86

High-Torque 12-Point Flange Nuts

With more contact points than a hex nut, these nuts allow you to get a better grip for more driver torque while tightening. They have a smooth flange base that distributes holding pressure and reduces stress where the nut meets the material surface. Thread fit is Class 3B.

Thread Size	Flange Dia.	O'all Ht.	Black-Oxide Chrome-Moly Alloy Steel	Each	A286 Super Alloy Stainless Steel	Each

Serrated Locknuts

Serrations on these nuts dig into surfaces to resist loosening. They're easier to install than other locknuts because they can be threaded on from either end and spin on freely until they make contact with the mating surface. They have a lower and narrower profile than serrated flange locknuts to fit in tight spaces. All nuts are zinc clear-chromate plated low-strength steel. Thread fit is Class 2B.

Serrated-Flange Locknuts

A serrated flange digs into the material surface to resist loosening. Also known as free-spinning locknuts, these are easier to install than nylon-insert and distorted thread locknuts because they don't grip the threads while being tightened. Inch sizes have a Class 2B thread fit. Metric sizes have a Class 6H thread fit and meet DIN 6923, unless noted.

★ Do not meet a DIN standard.

Nylon-Insert Nonmarring Flange Locknuts

These nuts have a nylon-insert that firmly grips threads and a flange that distributes holding pressure for a secure hold. They can be fastened without marring the material surface or damaging threads. They're reusable, but their holding power lessens with each use. Nylon absorbs moisture which can cause the insert to become brittle over time in wet environments. Maximum temperature of the insert is 250° F. Inch sizes have a Class 2B thread fit. Metric sizes have a Class 6H thread fit.

Cap Nuts

Also known as acorn nuts, the smooth rounded head covers and protects threads while providing a finished appearance. Inch sizes have a Class 2B thread fit. Metric sizes have a Class 6H thread fit and meet DIN 1587, except nylon 6/6 nuts do not meet a DIN specification.

Cap Nut Assortments

Assortments include cap nuts with a Class 2B thread fit. They come in a compartmented plastic case with lid chart.

Thread Sizes Included	No. of Nuts		
Nickel-Plated Low-Strength Steel			
6-32, 8-32, 10-32, 1/4"-20, 5/16"-18, 3/8"-16	200	91987A300	$35.50
18-8 Stainless Steel			
6-32, 8-32, 10-32, 1/4"-20, 5/16"-18, 3/8"-16	200	91987A800	110.91

Open-End Cap Nuts

An open dome allows these cap nuts to be used on bolts or rods of any length. Their domed shape provides a finished appearance. They're made from 18-8 stainless steel. All have a Class 2B thread fit.

Thread Size	Ht.	Wd.		Each
4-40	1/4"	5/16"	94301A105	$2.30
6-32	1/4"	5/16"	94301A110	2.30

1/2"-13	1/2"	3/4"	94301A160	5.50

Nylon-Insert Cap Locknuts

Seal exposed threads from internal and external pressure up to 80 psi. Resistant to loosening, they have a nylon insert that firmly grips threads. They're reusable, but their holding power lessens with each use. Nuts are steel with a nylon 6/6 cap and insert. They can withstand temperatures up to 250° F. Nylon absorbs moisture, which can cause the cap and insert to become brittle over time in wet environments. All have a Class 3B thread fit.

Thread Size	Thread Dp.	Ht.	Wd.	Pkg. Qty.		Pkg.
8-32	9/64"	23/64"	11/32"	25	98190A130	$3.58

3/8"-24	21/64"	5/8"	9/16"	10	98190A270	7.47

Distorted-Thread Cap Locknuts

A section of distorted threads keeps nuts locked in place once fastened. Their domed head covers and protects threads while providing a finished appearance. Nuts are 18-8 stainless steel. They're not reusable. All have a Class 2B thread fit.

Thumb Nuts

Round

Round with Shoulder

Round with Flange

Hex with Flange

With a prominent head for tightening or loosening by hand, these nuts are often used in applications requiring frequent adjustments. They're fully threaded, unless noted. Inch sizes have a Class 2B thread fit. Metric sizes have a Class 6H thread fit.

Round thumb nuts have finely knurled edges to allow a secure grip while tightening. **Hex** thumb nuts can be tightened with a wrench for more torque while fastening.

Reinforced nylon nuts have a maximum temperature of 200° F. *Acetal with aluminum threaded insert* nuts have a maximum temperature of 180° F.

High-Torque Thumb Nuts

Insert a rod or pin in the holes for increased torque while tightening. Also known as check nuts or jam nuts, place one against another to lock it in place. They're often used in jig and fixturing applications. All have a Class 2B thread fit.

Thread Size	O'all Dia.	O'all Ht.	Hole Size	Black-Oxide Steel	Each	18-8 Stainless Steel	Each

Panel Nuts

Extremely thin for use in tight spaces. Also known as electrical panel nuts and dress nuts, use them to mount switches into electrical panel cutouts. Hex nuts have a Class 2B thread fit. Round and locking nuts are not rated for thread fit.
Thread Types: NPS = National Pipe Straight Thread; NEF = National Extra Fine Thread; NS = National Special Thread; NPT = National Pipe Thread.

Wing Nut Assortment

Assortment includes zinc-plated steel wing nuts. All have a Class 2B thread fit. They come in a compartmented plastic case with lid chart.

Thread Sizes Included	No. of Nuts		
6-32, 8-32, 10-24, 1/4"-20, 5/16"-18, 3/8"-16	175	98191A416	$49.74

Nylon-Insert Wing Locknuts

These nuts have wide wings for hand tightening and a nylon-insert that grips threads for a firm hold. Nuts are made from zinc alloy. They're reusable, but their holding power lessens with each use. Nylon absorbs moisture which can cause the insert to become brittle over time in wet environments. Maximum temperature of the insert is 225° F. All nuts have a Class 2B thread fit.

Flange Wing Nuts

A flanged base distributes holding pressure to reduce stress where the nut meets the material surface. They can be used to cover oversized holes or as an alternative to a nut with a separate washer. Their wings allow for easy tightening by hand. Nuts are made from zinc alloy. All have a Class 2B thread fit.

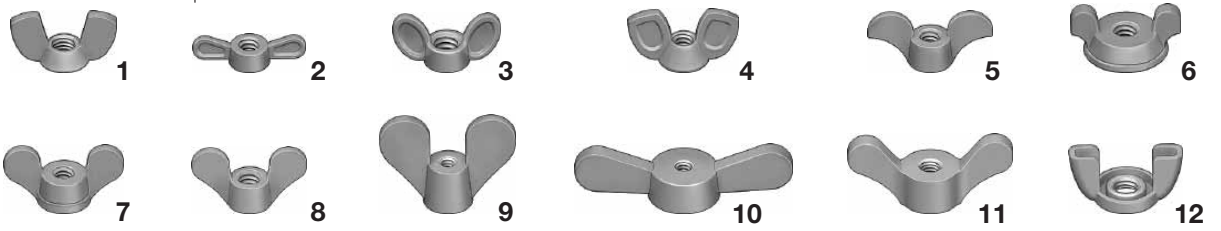
Wing Nuts



Wide wings provide a secure grip for tightening and loosening by hand. Wing nuts have a larger gripping area than thumb nuts and can be turned with more torque. They're often used in applications that require frequent adjustments.

Inch sizes have a Class 2B thread fit. Metric sizes have a Class 6H thread fit.

Push Nuts for Threaded Studs and Rods

Slide these nuts over threads to hold fasteners in place. They're often used for light-duty holding, such as securing panels.

Round Push Nuts and Push Nut Drivers

With flexible teeth that slide smoothly over threads of any pitch, these can be used as a standalone nut for light-duty applications or as a jam nut to keep hex nuts and bolts securely fastened.

Drivers have a magnetized shank that holds push nuts in place during installation.

Hex Push Nuts

Also known as hex speed nuts, these can be used as a standalone nut for light-duty applications or as a jam nut to keep hex nuts and bolts securely fastened. All are made from steel. Thread fit is Class 2B.

Thread Size	Finish	Wd.	Ht.	Pkg. Qty.		Pkg.

Flanged Push Nuts

A wide flange gives these nuts better load distribution than hex and rectangular push nuts. They're also known as flanged speed nuts. All are zinc-plated steel. They have a single Class 2B thread.

Rectangular Push Nuts

Also known as flat-style speed nuts, these nuts have a large surface area for better load distribution than hex push nuts for use with soft metals and plastics. They're black-phosphate steel. Thread fit is Class 2B.

Twist-On Nuts

Position at any point on a threaded rod for installations where access to the end of the rod is limited. Swivel the nut open and position it on the threaded rod, then twist closed to secure. Inch sizes have a Class 2B thread fit. Metric sizes have a Class 6H thread fit.

Push-Button Slide-Adjust Nuts

For quick installation and easy adjustments, push the button to disengage threads and slide the nut in place, then release the button and the threads engage. Nuts are made from black-oxide steel. Thread fit is Class 2B.

Hex Coupling Nuts

Extend lengths of threaded rod or join threaded parts. Also known as extension nuts, they're about three-times taller than standard hex nuts, allowing room to thread fasteners or threaded parts from both ends. Nuts are fully threaded, unless noted. Inch sizes have a Class 2B thread fit. Metric sizes meet DIN 6334 (unless noted) and have a Class 6H thread fit.

Hot-dipped galvanized nuts must be used with other hot-dipped galvanized fasteners for a correct thread fit.

Metric Round Coupling Nuts

With a smooth rounded body for a finished look, these nuts can be used to extend lengths of threaded rod or join threaded parts. Nuts are fully threaded. They're made from 18-8 stainless steel. All meet DIN 88088. Thread fit is Class 6H.

Tamper-Resistant Nuts

Difficult to remove without special tools, these nuts can be used to fasten objects in public spaces such as signs, lighting fixtures, and displays. Nuts have a Class 2B thread fit, except spanner nuts have a Class G3 thread fit. These nuts can be used with carriage bolts (see pages 3178-3179) where screw heads are inaccessible.

Sloped Nuts

These nuts have four sloped sides, making them difficult to grasp with standard hand tools once installed. To install, thread a second sloped nut onto the bolt upside down and insert a wrench between the two nuts to fasten. They're zinc yellow-chromate plated steel, except M6×1 are cadmium chromate steel. Nuts are reusable.

M10×1.5	1.05"	0.23"	5	98789A230	5.26

Breakaway Nuts

After Installation

More difficult to remove than sloped nuts, a hex head breaks away upon tightening, leaving a non-removable cone to keep property secure. These nuts can be installed using a standard wrench. They're made from aluminum. Nuts are not reusable.

Thread Size	Breaking Torque, in.-lbs.	Hex Wd.	Base Ht.	Pkg. Qty.		Pkg.

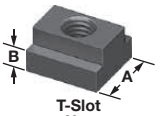
T-Slot Nuts



T-Slot Nut

Drop-In T-Slot Nut

Designed to fit into T-slot tracks on machine tool tables, these nuts can be used to secure clamps or work pieces. Inch sizes have a Class 2B thread fit. Metric sizes have a Class 6H thread fit.

T-slot nuts slide into T-slot tracks.

Drop-in T-slot nuts, also known as quarter-turn T-slot nuts, can be installed from the top of the T-slot track and secured with a quarter turn.

Fully threaded nuts allow a stud to extend beyond the bottom of the nut. *Partially threaded* nuts keep studs from traveling past the bottom of the nut and causing damage to your work table.

Press-In Nuts

Press into thin panels with an installation tool (see page 3238) or an arbor press. Installation requires access to both sides of the panel. Knurls on the bottom of the nut hold them firmly in place. They're also known as self-clinching, captive, and insert nuts. Inch sizes have a Class 2B thread fit, except nylon-insert locknuts have a Class 3B thread fit. Metric sizes have a Class 6H thread fit.

Nuts for soft metals and plastics are also known as broach style nuts and have a round head.

Nuts for sheet metal are also known as clinch style nuts. They have a round head, except metric nuts have a hex head.

Easy-align nuts have threads that float within the body to make alignment with mating holes easier.

Nylon-insert locknuts have a nylon 6/6 insert that grips threads to stay securely fastened. Maximum temperature is 250° F. Nylon absorbs moisture, which can cause the insert to become brittle over time in wet environments.

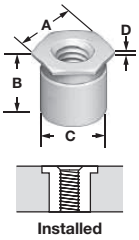
Installation Tools for Press-In Nuts

Kits include one hand tool, seven hole punches and dies, five fastener anvils, one flat punch, one punch adapter bushing, and one edge-depth guide. They come in a plastic case.

	For Screw Sizes		Each
For Inch Nuts	No. 2, No. 4, No. 6, No. 8, No. 10	90818A101	$426.96
For Metric Nuts	M2, M2.5, M3, M4, M5	90818A102	426.96

Flush-Mount Press-In Nuts



A flat hex head sits flush against the material surface for use in thin metal and plastic panels where space is limited. Install using an arbor press or similar tool. They're 18-8 stainless steel and may be mildly magnetic. All have a Class 2B thread fit.

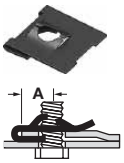
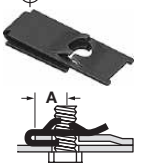
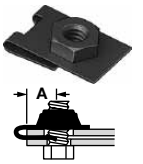
Clip-On Nuts







Also known as J-style nuts, slide them onto panels for a tight hold on assemblies. They're often used to add threads on the edge of materials that can't be welded or otherwise break easily, like plastic or thin metal panels. Nuts are black-phosphate spring steel.

Square style and **rectangle style** nuts are often used to secure parts on electric consoles. **Rectangle style with low-profile barrel** nuts, have multiple threads for a stronger hold.

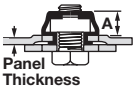
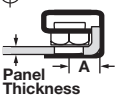
Easy-Align Clip-On Nuts

Square Style



G-Style



The nut floats within a retainer for easy alignment and installation of screws, bolts, and threaded rod.

Square style clip-on nuts are designed to fit into square holes. Mounting legs expand to lock the fastener in place. They can be installed by hand or with pliers. Nuts for #6 to 1/4″ size screws are 0.52″ wide; those for 5/16″ to 3/8″ size screws are 0.66″ wide, except nuts with (A) dimension of 0.41″ are 0.87″ wide; and those for 1/2″ size screws are 0.87″ wide. **G-style** clip-on nuts slide onto the edge of a panel.

No-Slip Clip-On Nuts

Screws thread through the top and bottom, so nuts don't slip or turn while being secured.

U-style with barrel nuts have a threaded insert for a stronger hold. Inch sizes have a Class 2B thread fit. Metric sizes have a Class 6H thread fit.

U-style with hex nut fasteners have a hex-shaped barrel to be gripped with a wrench. Thread fit is Class 2B.

S-style nuts, also known as cage clip-on nuts, have a threaded insert enclosed by a steel retainer. They can be used on a wide range of panel thicknesses. Thread fit is Class 3B.

Round Base Weld Nuts

With Barrel

With Barrel and Weld Nibs

Also known as insert nuts, weld these onto flat metal surfaces for a strong permanent hold. Round base nuts have a base with a larger surface area than tab base nuts for easier spot welding. They have a tall barrel to ensure secure thread engagement. Inch sizes have a Class 1B thread fit, except stainless steel nuts have a Class 2B thread fit. Metric sizes have a Class 6H thread fit.

Nuts with barrel and weld nibs have three weld projections on the flange.

Tab Base Weld Nuts

With Barrel

With Offset Low-Profile Barrel

With Low-Profile Barrel

With Low-Profile Barrel and Weld Nibs

Add threads to panel edges, narrow channels, and in square tubing. Weld them onto flat metal surfaces for a strong permanent hold. Inch sizes have a Class 2B thread fit, except uncoated steel nuts with barrel have a Class 1B thread fit. Metric sizes have a Class 6H thread fit.

Nuts with barrel have a tall barrel for secure thread engagement.

Nuts with low-profile barrel are designed for bridging corners and depressions. **Nuts with offset low-profile barrel** allow you to position threads near edges and corners. **Nuts with low-profile barrel and weld nibs** have a low-profile barrel and two weld projections on the barrel side.

Weld Nuts with Projections

Projections provide a large surface area for a strong welded joint. They have a collar pilot that assists alignment and prevents welding spatter from getting into threads.

Square nuts are for flat surfaces.

Hex nuts are for both flat and uneven surfaces.

Perforated Base Weld Nuts

Weld, nail, screw, rivet, or glue these nuts into place.

Style A nuts have three mounting holes to accept fasteners. Thread fit is Class 1B.

Style B nuts have three mounting holes, plus three protrusions that increase the weld surface for a strong bond. Thread fit is Class 1B.

Style C nuts have a wide base with a large surface area. They're drilled with multiple holes that allow glue or plastic to flow through. Thread fit is Class 2B.

Easy-Align Weld Nuts

Often referred to as floating weld nuts, the nut floats within a retainer for easy alignment and installation of screws, bolts, and threaded rod. You can also punch holes in the flanges and secure them with rivets. Inch sizes have a Class 2B thread fit. Metric sizes have a Class 6H thread fit.

Zinc-plated steel nuts with aluminum retainer are zinc-plated C1008-C1010 steel with an aluminum 5052 retainer. Weld them to aluminum parts.

Uncoated steel nuts with steel retainer are C1008-C1010 steel. Weld them to steel parts.

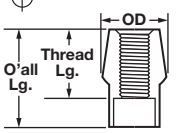
Tube-End Weld Nuts



Connect threaded parts and add threads to the ends of uncoated steel tubes. Also known as tube adapters and weldable threaded tube ends, they can be welded on uncoated metal surfaces. Nuts are 4130 alloy steel. They have a Class 2B thread fit.

Push Nuts for Unthreaded Shafts

Push Nuts and Push Nut Drivers

A

B

C

Push Nut Driver

Hold attachments firmly in place on unthreaded rods, shafts, and axles. They can be installed using a push nut driver (sold separately).

Push nut drivers have a magnetized steel shank that holds push nuts in place during installation.

About Washers

Types of Washers

Flat washers (pages 3244-3259) are primarily used to displace the load of a fastener head or a nut on a threaded joint. They can cover holes and act as spacers.

Lock washers (pages 3259-3265) resist vibration to prevent a threaded joint from loosening.

Cushioning washers (pages 3265-3266) protect joints and dampen vibration.

Sealing washers (pages 3266-3268) prevent fluids from leaking around connections.

Countersunk washers (pages 3268-3269) give flat- and oval-head machine screws and flat-head socket cap screws a neat, finished appearance.

Sleeve washers (page 3269) act as a barrier around fasteners to block electrical current and prevent corrosion from mating different materials.

Square-neck bolt washers (page 3269) have teeth to dig into soft materials to prevent rotation.

Leveling, alignment, and **wave** washers (pages 3269-3270) compensate for tolerance variations and uneven surfaces.

Blind rivet washers (page 3271) are also known as backup washers and are for use with blind rivets for extra support when fastening into soft materials.

Notched washers (page 3271) have indentations for temporarily securing them with nails to keep them from rotating during installation. They have large ODs to prevent screws from sinking into wood surfaces.

Curved washers (page 3271) are designed to fit on round surfaces such as tubes and pipe.

Slotted washers (page 3271) allow you to install and remove them without completely disassembling your joints.

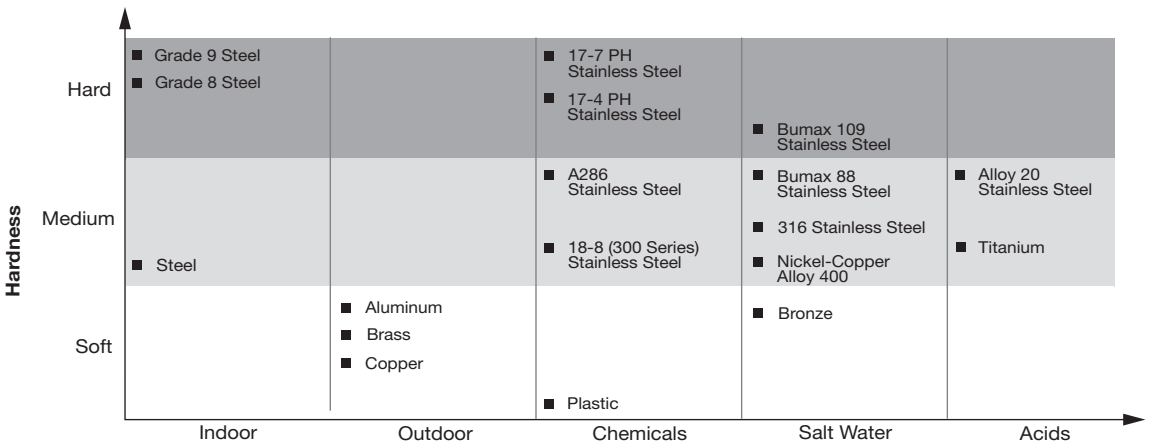
Tie-down strap washers (page 3271) are often used to hold and align tie-down straps.

Electrical terminal washers (pages 3271) prevent wires under screw heads from slipping out so electrical connections stay intact.

Washers for **foam insulation** and **plaster** (page 3271) are used to repair foam insulation and sagging, cracked plaster.

Clipped washers (page 3263) fit where standard flat washers can't and won't rotate when you position the flat edge against a surface.

Comparing Washer Materials and Coatings



The addition of a coating increases the corrosion-resistance properties of the materials shown above.

Black Oxide—This coating allows steel to handle humid indoor environments.

Zinc and **Zinc Yellow-Chromate Plated—**These coatings are good for use outdoors.

Hot-Dipped Galvanized—This coating has 10 times more corrosion resistance to outdoor environments than zinc and zinc yellow-chromate platings.

Cadmium Plated—This coating resists corrosion from salt water.

Passivated—This coating adds another level of corrosion resistance to stainless steel.

Ultra Corrosion-Resistant Coated—Also known as armor coat and ultra coat, this silver-colored zinc-aluminum coating resists corrosion from chemicals and passes the 1,000-hour salt-spray test.

Black Luster—This durable semigloss coating resists corrosion from acids and chemicals, and passes the 1,000-hour salt-spray test.

Brass	No. 8, No. 10, 1/4", 5/16", 3/8", 1/2"	550	Plastic	92075A306	95.25

Oversized Washers

Compared to our general purpose washers, these have exaggerated outside diameters and/or thicknesses. Washers with large outside diameters are good for covering oversized holes and are also known as fender washers. Thick washers can be used as spacers and levelers and are also known as fixture or setup washers.

(Continued on following page)

Oversized Washers *(Continued from previous page)*

Compared to our general purpose washers, these have exaggerated outside diameters and/or thicknesses. Washers with large outside diameters are good for covering oversized holes and are also known as fender washers. Thick washers can be used as spacers and levelers and are also known as fixture or setup washers.

Assortment

Furnished in a compartmented plastic case with lid chart to identify washers.

Material	Screw Sizes Included	No. of Washers		
Zinc-Plated Steel	No. 5, No. 6, No. 10, 1/4", 5/16", 3/8"	386	98661A252	$94.92

USS Washers

USS washers are a widely used standard of washers. They generally have a larger ID and OD than SAE washers.

Steel— Dimensions are the same as zinc-plated steel above. Choose a screw size: No. 10 to 3" 91081A400

Assortment

Furnished in a compartmented plastic case with lid chart to identify washers.

Material	Screw Sizes Included	No. of Washers		
Zinc-Plated Steel	1/4", 5/16", 3/8", 1/2", 5/8", 3/4"	590	91535A110	$55.03

SAE Washers

SAE washers are a popular standard of washers. They generally have a smaller ID and OD than USS washers.

SAE Washers for Soft Materials

Designed to distribute your fastener's load over a larger surface area than other SAE washers, these washers limit damage to soft materials. They are also known as Type B washers.

Washers for Structural Bolts

Intended for use with A325 structural bolts, studs, and nuts, these washers are good for construction and exterior building applications. They meet ASTM F436 (Type 1).
Washers with **tension indicator** release an orange dye when tightened.

Steel

Steel with Tension Indicator

Square Washers for Slots

Square washers fit into slots and channels and have flat sides to keep them from rotating. They are wider and thicker than most round washers, making them good for distributing heavy loads.

Other Materials

Dimensions are the same as 18-8 stainless steel above. **Bumax 109 stainless steel** washers also meet ISO 7089.

Material	Choose a Screw Size	
Black-Oxide 18-8 Stainless Steel	M3 to M6	98269A410
Bumax 109 Stainless Steel	M6 to M12	94316A300
Ultra Corrosion-Resistant Coated High-Strength Class 10.9 Steel	M4 to M42	91455A881
Black-Luster Coated Steel	M3 to M14	93413A881
Aluminum	M1 to M20	92334A881
Brass	M1.6 to M24	91635A430
Copper	M3 to M24	98044A881

Assortment—Furnished in a compartmented plastic case with lid chart to identify washers. Washers meet DIN 125.

Material	Screw Sizes Included	No. of Washers		
Zinc-Plated Steel	M3, M4, M5, M6, M8, M10, M12, M14, M16	825	98018A424	$56.59

Metric Oversized Washers

Compared to metric general purpose washers with the same screw size, these have exaggerated outside diameters and/or thicknesses. Washers with large outside diameters are good for covering oversized holes and are also known as fender washers. Thick washers can be used as spacers and levelers and are also known as fixture or setup washers.

Extreme-Temperature Ceramic Washers

Ceramic washers won't melt—even at temperatures up to 3000° F. They are good electrical insulators and have excellent resistance to moisture as well as hydrochloric and nitric acid gases. Suitable for use in ovens. Color is off-white.

Mil. Spec. Plastic Washers

Washers meet military standard NAS 1515. Color is white.
Nylon washers are good electrical insulators. Not rated for maximum temperature.
PTFE washers are slippery and excellent electrical insulators. They have excellent moisture and chemical resistance. Maximum temperature is 500° F.

Other Metric Materials

Material	Choose a Screw Size	Color	
PEEK	M2 to M20—Dimensions are the same as Nylatron on previous page.	Tan	93785A200
Phenolic	M2 to M6—Dimensions are the same as Delrin® Acetal Resin on previous page.	Red-Brown to Yellow-Brown	91225A110
Fiberglass	M2 to M6—Dimensions are the same as Delrin® Acetal Resin on previous page.	Light-Green to Light-Tan	93493A310

Assortment—Furnished in a compartmented plastic case with lid chart to identify washers. Washers are off-white.

Material	Screw Sizes Included	No. of Washers		
Nylon	No. 4, No. 6, No. 8, No. 10, 1/4", 5/16", 3/8"	1,050	98740A080	$38.62

Split Lock Washers

Split lock washers prevent bolted joints from loosening under small amounts of vibration. As a screw is tightened, these washers are forced into a flat shape, which adds tension to your joint for a tight hold. **Metric** washers meet DIN 127B, except high-visibility blue steel washers do not.

Oversized Split Lock Washers

Compared to our other split lock washers, these have larger outside diameters and thicknesses. Use them to prevent bolted joints from loosening under small amounts of vibration. As a screw is tightened, split lock washers are forced into a flat shape, which adds tension to your joint for a tight hold.

Mil. Spec. Split Lock Washers

Washers meet MS 35338. All are 300 series passivated stainless steel. As the fastener is tightened, the split lock washer is forced into a flat shape, which adds tension to your joint for a tight hold under small amounts of vibration.

Nonmarring Diamond-Coated Lock Washers

Achieve the gripping power of a tooth lock washer without visibly damaging surfaces with these diamond-coated washers. The diamonds grip on to surfaces to keep bolted joints from loosening under vibration. Washers are reusable.

Split Lock Washers for Socket Head Cap Screws

Also known as high-collar lock washers, these have smaller ODs than other split lock washers to fit neatly under socket head cap screws. As the socket head cap screw is tightened, the split washer is forced into a flat shape, which adds tension to your joint for a tight hold under small amounts of vibration. **Metric** washers meet DIN 7980.

External-Tooth Lock Washers for Countersunk Screws

The teeth on these washers firmly grip heads of 82° flat-head countersunk screws to prevent joints from loosening under vibration.

400 series stainless steel washers can also be used with 82° oval-head countersunk screws.

External-Tooth Lock Washers

Standard

Serrated

Teeth on the outside edge of the washers bite into your screw head and joint for a tighter grip against vibration and loosening than split lock washers. Use these washers with fasteners having heads large enough to make contact with the teeth, such as binding head, pan head, and round head screws.

Serrated washers have angled teeth for an even tighter hold.

Standard—Metric washers meet DIN 6797.

Internal/External Tooth Lock Washers

The combination of internal and external teeth boosts your gripping power to maintain a tight hold of bolted joints under vibration. Made from zinc-plated steel.

Internal-Tooth Lock Washers for Soft Materials

Slightly domed with an oversized OD, these washers distribute your fastener's load over a larger surface area than other internal-tooth lock washers to limit damage to soft materials. Internal teeth dig in to your screw head to prevent bolted joints from loosening under vibration. Made from zinc-plated steel.

Internal-Tooth Lock Washers

Internal teeth dig in to your screw head to resist loosening while the smooth outside edge won't snag objects. These washers provide greater vibration resistance than split lock washers. They're good for use with fasteners having small heads, such as high-profile fillister and cheese head screws. **Metric** washers meet DIN 6797.

Assortment

Includes 700 internal-tooth and 635 external-tooth lock washers in a compartmented plastic case with lid chart to identify washers.

Material	Screw Sizes Included	No. of Washers		
Zinc-Plated Steel	No. 2, No. 4, No. 6, No. 8, No. 10, 1/4″, 5/16″, 3/8″, 1/2″	1,335	98651A192	$35.43

Mil. Spec. Tooth Lock Washers

Washers meet strict military standards. All are 410 stainless steel and provide greater resistance to vibration and loosening than split lock washers.

External-tooth washers bite into your screw head and joint. Use them with fasteners having heads large enough to make contact with the teeth on the outside edge, such as binding head, pan head, and round head screws.

Internal-tooth washers dig into your screw head while the smooth outside edge won't snag objects. They're good for use with fasteners having small heads, such as high-profile fillister and cheese head screws.

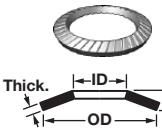
Belleville Spring Lock Washers



Also known as conical washers, these washers have a slightly cupped shape that gives them spring-like flexibility to grip joints tighter than split and tooth lock washers. Use them to prevent joints from loosening due to wear, temperature changes, and vibration. For Belleville disc springs, see pages 1294-1297.

Washers **for socket head cap screws** have small ODs to fit neatly under the heads of socket head cap screws. They are serrated on the top and bottom for extra gripping power.

Washers **for machine and hex head cap screws** have larger ODs to grip the heads on machine and hex head cap screws. *Inch steel* washers are serrated on the top for extra gripping power. *Metric* washers meet DIN 6796.

For Socket Head Cap Screws

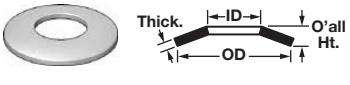
Spring Lock Washers for Plastic Screws



Designed for use with plastic screws, these acetal washers have a slightly cupped shape that gives them spring-like flexibility to grip joints tighter than split and tooth lock washers. All are good electrical insulators and are excellent for use under water and in rotating assemblies. Temperature range is –40° to 212° F. Color is white.

Wedge Lock Washers

Also called NORD-LOCK® washers, these provide more locking power than split, tooth, and spring lock washers. They come as a pair of washers with wedges on the inside that lock against each other to prevent loosening. When mated, the exterior sides have serrations to hold tight under high vibration and shifting. Washers are reusable.

Cushioning Washers

Use these felt washers to cushion and insulate joints as well as dampen vibration. They're made of wool and can be soaked with oil to create lubricated joints. Temperature range is –80° to 200° F. Color is gray.

Chemical-Resistant Cushioning Washers

Made of Buna-N, these washers offer excellent chemical, weather, and oil resistance. They are good for dampening vibration and cushioning joints and have an indented grid pattern to prevent sideways shifting. Maximum temperature is 200° F. Color is black.

Rubber Sealing Washers

Rubber washers resist water, oil, weather, and/or chemicals to create a light duty seal on your joints and dampen vibration. Use the chart below to identify the best rubber for your application. Information is intended for comparison only.

● Excellent ◓ Good Blank boxes indicate a poor rating or no rating.

Metal Sealing Washers

Also known as crush washers, these washers compress when tightened to form a tighter, more durable seal than rubber washers. They are commonly used to seal fluids such as oil and fuel. All meet DIN 7603. Washers are not reusable.

Pressure-Sealing Washers

When tightened, these zinc-plated steel washers with Buna-N seals form a tighter grip than rubber and metal sealing washers. The Buna-N seal is black with excellent abrasion resistance and good oil, weather, and chemical resistance. Washers are reusable. Temperature range is –30° to 225° F.

For Nuts and Washers—Also known as thread-sealing washers. Use under nuts and washers.

For Screws and Bolts—Also known as stat-o-seal washers. Use under fastener heads.

For Nuts and Washers

Metal-Bonded Sealing Washers

These one-piece rubber-to-metal bonded washers have a rubber seal to create a tight grip on your joints and a metal backing for strength. Washers are reusable.

Neoprene has good oil and abrasion resistance and is black. Temperature range is –45° to 250° F. Not rated for pressure.

Silicone has excellent weather resistance and is green. Temperature range is –160° to 500° F. Max. pressure is 100 psi.

High-Pressure Metal-Bonded Sealing Washers

Able to withstand up to 8,500 psi of liquid pressure, these one-piece metal-bonded washers have the tightest seals. They're 316 stainless steel bonded to a black plastic sealant. When tightened, the sealant releases from under the washer and creates an impervious 360° seal around your fastener's threads. Washers have excellent oil and chemical resistance. They are not reusable. Temperature range is –60° to 275° F.

Self-Retaining Washers

A specially shaped ID grips your screw shank tightly. Washers are nylon and are good electrical insulators. Temperature range is –40° to 185° F. Color is off-white.

Sleeve Washers

These nylon washers block electrical current and prevent corrosion from mating different metals. Temperature range is –40° to 185° F. Color is off-white.

Cup washers have a flat bottom and high walls to protect metal screw heads.

Rolled-collar washers fit under screw heads to create a barrier between screw shanks and mating surfaces.

Flanged washers are similar to rolled-collar washers with the addition of a shank that extends into holes to provide an even greater barrier.

Wave Washers

Single Wave

Triple Wave

These curved, flexible washers act like springs to compensate for tolerance variations and uneven surfaces. You can also use them to dampen vibration and rattling connections.

Triple-wave washers contact surfaces at three points for more stability than single-wave washers.

Washers for Foam Insulation and Plaster

Attach foam insulation or repair sagging, cracked plaster with these washers. Use them with self-sinking flat head (bugle head) screws. Washers are galvanized steel.

Washers **for foam insulation** have prongs that pierce insulation so they stay in place.

Washers **for plaster** have holes that allow plaster to flow through to form a secure bond between the washer and the wall.

For Foam Insulation

For Plaster

	Screw Size	ID	OD	Thick., Min.-Max.		Pkg. of 50
For Foam Insulation	No. 8	0.175"	1.250"	0.020"-0.024"	95880A900	$6.90
For Plaster	No. 10	0.235"	1.250"	0.020"-0.024"	95880A500	6.90

Anti-Rotating Clipped Washers

Clipped to fit where standard washers can't, these washers won't rotate when you position the flat edges against a flat surface. Washers are steel.

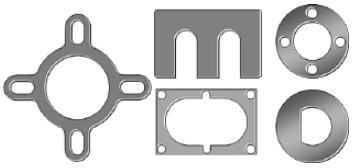
Shim Stock

Made-to-Order Shims



If you need a unique shim shape or size, send us your CAD file and we'll precision cut them to your specifications. Select a material and thickness from the choices below. We will send you as many same-design shims as an 11″×11″ sheet will yield. A traceable lot number and material test report are included. Width and length tolerances are ±0.010″ for 0.001″ to 0.005″ thick sheets and ±0.005″ for 0.006″ to 0.02″ thick sheets.

316 stainless steel has excellent corrosion resistance and may be mildly magnetic. It is cold rolled and has a soft (annealed) temper. Maximum Rockwell hardness is B88. Sheets meet ASTM A240 and Fed. Spec. QQ-S-766.

Low-carbon steel is magnetic. Material will vary between 1008-1010 steel. It is cold rolled and has a full hard temper. Minimum Rockwell hardness is B90. Sheets meet ASTM A109 and Fed. Spec. QQ-S-698.

Thick.	Thick. Tolerance	316 Stainless Steel		Low-Carbon Steel

Stainless Steel Shim Stock

Stainless steel shim stock withstands corrosive environments. It is cold rolled. A traceable lot number and material test report are included. **18-8, 301,** and **316 stainless steel** may be mildly magnetic. **17-4 PH** and **17-7 PH stainless steel** are magnetic and stronger than 18-8, 301, and 316.

18-8 Stainless Steel Rolls—Full Hard Temper

Width tolerance is ±0.005″ for 6″ and 12″ wide rolls and +1″, –0.010″ for 24″ wide rolls. Length tolerance is +½″, –¼″. Rockwell hardness is C40-C45. Rolls meet ASTM A666.

Shim Stock

Spring Steel Shim Stock

Spring steel shim stock is the hardest shim stock we offer. It is cold rolled and magnetic. A traceable lot number and material test report are included. **Grade 1095** is also known as blue-tempered steel. **Grade 1075** is also known as scaleless blue steel.

1095 Spring Steel Rolls—Full Hard Temper

Width tolerance is ±0.010″. Length tolerance is +½″, –¼″. Rockwell hardness is C48-C51. Rolls are polished and meet ASTM A682, ASTM A684, and MIL-S-7947.

Aluminum Shim Stock

This lightweight aluminum shim stock has good electrical conductivity. It is cold rolled and nonmagnetic. Material will vary between Alloys 1100, 1145, and 1235. A traceable lot number and material test report are included.

1100/1145/1235 Aluminum Rolls—Full Hard Temper

Width tolerance is ±0.005″. Length tolerance is ±1/16″. Rolls are not rated for hardness. They meet ASTM B209.

Thick.	Thick. Tolerance	6″×50″		6″×100″	
0.001″	±0.00005″	9708K51	$21.60	9708K11	$30.18

Nickel Shim Stock

Nickel shim stock is the most corrosion-resistant shim stock we offer. It is cold rolled and magnetic. Material will vary between Alloys 200 and 201. A traceable lot number and material test report are included.

200/201 Nickel Rolls—Soft (Annealed) Temper

Width tolerance is ±0.005″. Length tolerance is ±1/16″. Rockwell hardness is B42-B67.

Thick.	Thick. Tolerance	6″×25″		6″×50″	
0.001″	±0.00005″	9707K71	$65.76	9707K11	$93.52

59-Sheet Multi-Material Assortment—Includes one 6″×12″ sheet of each thickness of the 302 stainless steel, 1010 low-carbon steel, 1095 spring steel, 1100 aluminum, 110 copper, 260 brass, and 510 bronze listed in the table above. Assortment comes in a 24″ Ht.×30″ Wd.×11½″ Dp. steel cabinet.

9300K59 ..... $492.29

Shim Stock

PTFE Shim Stock

PTFE is a low-friction alternative to metal shim stock. Color is white. Temperature range is –110° to 500° F.

PTFE Sheets

Width and length tolerances are ±1/8″. Rockwell hardness is C37-C41. Sheets meet ASTM D3308 and MIL-T-22241.

Thick.	Thick. Tolerance	8″×12″	
0.001″	±0.0001″	1192N11	$3.03
0.002″	±0.0002″	1192N12	4.80
0.003″	±0.0003″	1192N13	6.60
0.005″	±0.0005″	1192N14	9.75
0.01″	±0.001″	1192N15	13.99
0.015″	±0.0015″	1192N16	16.25

Plastic Shim Stock

Lightweight and corrosion resistant, these sheets are scored into 2″×6″ sections to make size adjustments easy. Color is black. Sheets are not rated for temperature. Width and length tolerances are ±1/4″. Sheets meet ASTM D638.

0.063″ thick sheets are molded polystyrene. Rockwell hardness is M60-M74. **0.125″** and **0.25″** thick sheets are ABS plastic. Rockwell hardness is R103-R112.

Thick.	Thick. Tolerance	Pkg. Qty	6″×6″	Pkg. 1-4	Pkg. 5-Up
0.063″	±0.032″	8	95015K5	$3.73	$3.20
0.125″	±0.01″	8	95015K6	6.75	5.81
0.25″	±0.012″	8	95015K7	12.54	10.60

Metal Shim Stock Discs

Shim stock is already disc-shaped—cut out the middle to create your shims. It is cold rolled. A traceable lot number and material test report are included. **302 stainless steel** has good corrosion resistance and may be mildly magnetic. **1008-1010 low-carbon steel** can be welded and is magnetic. Material will vary between 1008-1010 steel.

302 Stainless Steel—Full Hard Temper

Diameter tolerance is ±0.005″. Rockwell hardness is C40-C45. Discs meet ASTM A666.

Color-Coded Plastic Shim Stock

Identify shim thickness by color. This extruded plastic shim stock resists rust and oil. **0.0005″ to 0.0125″ thicknesses** are polyester. Maximum temperature is 200° F. **0.015″ to 0.06″ thicknesses** are PETG. Maximum temperature is 140° F.

Rolls

Width and length tolerances are ±1/16″. Rolls are not rated for hardness.

Color-Coded Aluminum Shim Stock

Stronger than plastic and designed for heavy duty use, these painted nonmagnetic sheets let you identify shim thickness by color. They are cold rolled. A traceable lot number and material test report are included.

1100, 1200, and 3003 Aluminum Sheets—½ to Full Hard Temper

Width and length tolerances are ±1/16″. Hardness is Brinell 32-45. **0.002″, 0.003″,** and **0.005″ thick sheets** are Alloy 1200. **0.004″, 0.007″,** and **0.01″ thick sheets** are Alloy 1100. **0.015″ to 0.03″ thick** sheets are Alloy 3003. **10-piece assortments** include one sheet each of 0.002″ to 0.03″ thicknesses.

Metal Peel-Away Shim Stock

After you create your shims, this shim stock allows you to remove layers with a utility knife to adjust the thickness. All sheets are cold rolled. **302 stainless steel** has good corrosion resistance and may be mildly magnetic. **1008 low-carbon steel** can be welded. It is magnetic. **1100 aluminum** has good electrical conductivity. It is nonmagnetic. **260 brass** is nonmagnetic and has some corrosion resistance.

302 Stainless Steel Sheets—Soft (Annealed) Temper

Width and length tolerances are ±1/16″. Sheets are not rated for hardness.

Shim Tape

Layer strips of tape to build up worn spots. Tape is 18-8 stainless steel foil with acrylic adhesive and a paper liner. It can be cut to size. Temperature range is –30° to 250° F.

Wd.	Thick.	Lg., ft.		
1/4″	0.004″	9	1143N22	$4.14

Stainless Steel Round Shims

Precisely align, level, and adjust spacing on shafts and machinery in corrosive environments. Shims may be mildly magnetic. **316 stainless steel** shims have excellent corrosion resistance. **18-8 stainless steel** shims have good corrosion resistance.
Inch Shims—Meet ASTM A240. ID tolerance is +0.011″. OD tolerance is ±0.002″. Minimum Rockwell hardness is B70.
Metric Shims—ID tolerance is ±0.3 mm. OD tolerance is ±0.05 mm. *316 stainless steel* shims have a minimum Rockwell hardness of B70-C45. *18-8 stainless steel* shims have a minimum Rockwell hardness of B70.

(Continued on following page)

Stainless Steel Round Shims *(Continued from previous page)*

Precisely align, level, and adjust spacing on shafts and machinery in corrosive environments. Shims may be mildly magnetic. **18-8 stainless steel** shims have good corrosion resistance.

Metric Shims—ID tolerance is ±0.3 mm. OD tolerance is ±0.05 mm. *18-8 stainless steel* shims have a minimum Rockwell hardness of B70.

Steel Round Shims

The strongest round shims we offer for precision aligning, leveling, and spacing on shafts and machinery.

Steel shims are 1008-1010 steel. **Spring steel** shims are harder and hold their shape better than steel shims.

Inch Shims—ID tolerance is +0.011″. OD tolerance is ±0.002″, except 0.188″ and 0.250″ thick shims are ±0.01″. *Steel shims* have a minimum Rockwell hardness of B65. *Spring steel* shims are a minimum of 1075 steel. Minimum Rockwell hardness of C44.

Metric Shims—They are spring steel and meet DIN 988. ID tolerance is +0.03 mm to +0.4 mm. OD tolerance is –0.04 mm to –0.47 mm. Rockwell hardness is B85-B95.

(Continued on following page)

Steel Round Shims *(Continued from previous page)*

The strongest round shims we offer for precision aligning, leveling, and spacing on shafts and machinery.
Spring steel shims are harder and hold their shape better than steel shims.
Metric Shims—They are spring steel and meet DIN 988. ID tolerance is +0.03 mm to +0.4 mm. OD tolerance is –0.04 mm to –0.47 mm. Rockwell hardness is B85-B95.

Aluminum, Brass, and Copper Round Shims

These nonmagnetic shims precisely align, level, and adjust spacing on shafts and machinery. ID tolerance is +0.011″. OD tolerance is ±0.002″.
Aluminum shims are lightweight. They are Alloy 1100 or 5052 and offer good corrosion resistance. They are not rated for hardness.
Brass shims are Alloy 260 or 360 and have good strength and corrosion resistance. They meet ASTM B36. Minimum Rockwell hardness is B60.
Copper shims are Alloy 110 or 510 and have excellent electrical conductivity and are corrosion resistant. They meet ASTM B152 and are not rated for hardness.

PTFE Round Shims

An alternative to metal shims, PTFE shims are low friction and handle aligning, leveling, and spacing on shafts and machinery in high-temperature applications. Maximum temperature is 500° F. ID tolerance is +0.015″. OD tolerance is ±0.01″. Color is white. Shims are not rated for hardness.

98085A440 ..... $93.24

Oversized Round Shims

Also known as machinery bushings, these shims cover a greater surface area than other round shims and reduce friction and wear between moving parts. ID tolerance is +0.025″, –0.01″. OD tolerance is ±0.010″. Minimum Rockwell hardness is B20, except 0.187″ thick shims are not rated for hardness. **18-8 stainless steel** shims offer good corrosion resistance and may be mildly magnetic. **Zinc-plated steel** shims are 1006-1020 steel and have good rust resistance. **Steel** shims are 1006-1020 steel.

Color-Coded Plastic Round Shims

Not only are these shims a nonconductive and oil resistant alternative to metal shims, they allow you to identify thickness by color. ID tolerance is +0.005″, –0.015″. OD tolerance is ±0.005″. Thickness tolerance is ±5%.

0.001″ to 0.005″ thick shims are polyester. Temperature range is –90° to 300° F.

0.0075″ to 0.030″ thick shims are PVC. Temperature range is –10° to 155° F.

Shims

Peel-Away Round Shims

Remove layers with a utility knife until you get the thickness you need. Layers are 0.002″ thick and bonded with adhesive. ID and OD tolerances are ±0.01″.

18-8 stainless steel shims have good corrosion resistance. They may be mildly magnetic. Minimum Rockwell hardness is B75.

Aluminum shims are lightweight and more corrosion resistant than brass. They are Alloy 1100 and not rated for hardness.

Brass shims have good strength and are corrosion resistant. They are Alloy 260 and not rated for hardness.

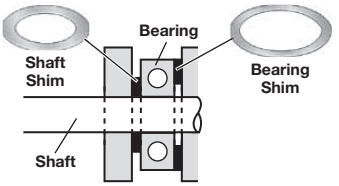
Shims for Shafts and Bearings



Use these shims to space rotating gears and bearings. Thickness tolerance for shims 0.001″ to 0.008″ thick is ±0.0005″ and shims 0.010″ to 0.020″ thick have a thickness tolerance of ±0.001″, except all alloy steel shims for shafts have a thickness tolerance of ±0.002″.

Shims for shafts fit snug around shafts. ID tolerance is +0.005″. OD tolerance is ±0.005″. **Shims for bearings** fit the outer rim of the bearing. ID tolerance is +0.005″. OD tolerance is –0.005″.

316 stainless steel shims have excellent corrosion resistance and may be mildly magnetic. Minimum Rockwell hardness is B90-B100.

18-8 stainless steel shims have good corrosion resistance and may be mildly magnetic. Minimum Rockwell hardness is B70-B90.

Brass shims have good strength and are corrosion resistant. They are Alloy 260. Minimum Rockwell hardness is B70-B80.

Alloy steel shims are the hardest. They are Alloy 4140 and have a minimum Rockwell hardness of C40-C50.

Shims for Keyed Drive Shafts

Also known as arbor spacers, these shims are notched to fit over keyed shafts.

Steel shims are 1008-1010 steel and have a minimum Rockwell hardness of B84. ID tolerance is +0.011″. OD tolerance is ±0.002″. Notch width tolerance is +0.010″ to +0.017″; notch depth tolerance is +0.008″ to +0.026″.

Alloy steel shims are the hardest. They are 4045 steel and have a minimum Rockwell hardness of C40. ID tolerance is +0.003″. OD tolerance is ±0.005″. Notch width and depth tolerance is ±0.004″.

18-8 stainless steel shims have good corrosion resistance and may be mildly magnetic. Minimum Rockwell hardness is B80. Thickness tolerance is ±17%. ID tolerance is +0.011″. OD tolerance is ±0.002″. Notch width and depth tolerances are ±0.005″.

Shims for Die Punches

Place these shims under sharpened dies to restore their original height and extend the life of the dies. ID and OD tolerances are ±0.020″. Minimum Rockwell hardness is C44.

0.005″ thick shims are 1095 spring steel. **0.015″** and **0.032″ thick** shims are 1075 spring steel.

450-Piece Assortment—Includes 25 each of 0.005″ and 0.015″ thicknesses in these ODs: 1/4″, 5/16″, 3/8″, 7/16″, 1/2″, 5/8″, 3/4″, 7/8″, and 1″.

99432A214 $178.42

Easy-to-Install Round Shims

Align, level, and adjust spacing without disassembling your machinery—shims are slotted so you can slip them into place. OD tolerance is ±0.03″. Shims are not rated for hardness.

18-8 stainless steel shims have good corrosion resistance and may be mildly magnetic.

Zinc-plated steel shims are 1006-1015 steel and resist rust.

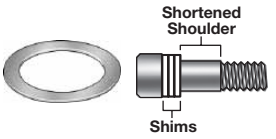
Shims for Shortening Screw Shoulders



Slide a shim onto your screw to shorten the shoulder length.

316 stainless steel shims have excellent corrosion resistance and may be mildly magnetic. Minimum Rockwell hardness is B70. **18-8 stainless steel** shims have good corrosion resistance and may be mildly magnetic. Minimum Rockwell hardness is B70. **Spring steel** shims are 1074-1095 steel. Minimum Rockwell hardness is C40.

Inch Shims—ID tolerance is +0.011″. OD tolerance is +0.002″, –0.005″.

Metric Shims—ID tolerance is +0.25 mm. OD tolerance is –0.25 mm.

Assortments

198-Piece Spring Steel—Assortment includes 16 of 0.015″ and 17 of 0.032″ thicknesses for shoulder diameters: 1/4″, 5/16″, 3/8″, 1/2″, 5/8″, and 3/4″. Assortment comes in a plastic box.

91124A600 ..... $129.83

270-Piece Spring Steel—Assortment includes 15 each of 0.005″, 0.015″, and 0.032″ thicknesses for shoulder diameters: 1/4″, 5/16″, 3/8″, 1/2″, 5/8″, and 3/4″. Assortment comes in a plastic box.

91124A800 ..... $140.68

Shims for Lengthening Screw Shoulders

Spin these tight-fitting shims onto your screw's threads to extend the shoulder length. **316 stainless steel** shims have excellent corrosion resistance. They may be mildly magnetic. **18-8 stainless steel** shims have good corrosion resistance and may be mildly magnetic. **Spring steel** *inch shims* are 1075-1095 steel; *metric* are 1075 steel.

Inch Shims—ID tolerance is +0.011″. OD tolerance is ±0.002″. *316 stainless steel* shims have a minimum Rockwell hardness of B70-C45. *18-8 stainless steel* shims have a minimum Rockwell hardness of B70. *Spring steel* shims have a minimum Rockwell hardness of C40.

Metric Shims—ID tolerance is +0.254 mm and OD tolerance is –0.254 mm. Minimum Rockwell hardness is C40.

Assortments

270-Piece Spring Steel—Includes 15 each of 0.005″, 0.015″, and 0.032″ thicknesses for shoulder diameters: 1/4″, 5/16″, 3/8″, 1/2″, 5/8″, and 3/4″. Assortment comes in a plastic box.

91140A800 ..... $92.76

300-Piece Spring Steel—Includes fifty 0.015″ thick shims for shoulder diameters: 1/4″, 5/16″, 3/8″, 1/2″, 5/8″, and 3/4″. Assortment comes in a plastic box.

91140A600 ..... $65.82

Hinge Shims

Slide a shim behind your door's hinge to properly align it in the jamb. To select the correct shim, measure your door hinge leaf height. Shims are plastic and have a universal hole pattern. They can be cut with a knife. Durometer is 60D. Temperature range is –30° to 175° F.

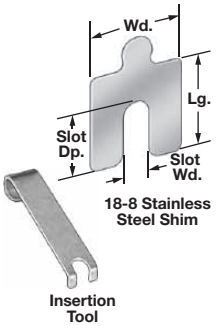
Shims and Insertion Tools



Shims are etched with the thickness. They may be mildly magnetic. Insertion tools (sold separately) hook onto the tab to give you leverage and reach. Note: Shim prices are 15% lower when you buy in multiples of 10.

18-8 stainless steel shims have good corrosion resistance. Minimum Rockwell hardness is B85.

316 stainless steel shims have excellent corrosion resistance. Minimum Rockwell hardness is C36-C50.

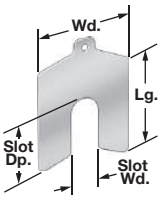
Metric 18-8 Stainless Steel Slotted Shims with Tab

These corrosion-resistant shims have a slot and tab so they can be inserted, removed, and adjusted without disassembling your machinery.

Trade Size	A	B	C
Shim Lg. × Wd., mm	50 × 50	75 × 75	100 × 100
Slot Wd. × Dp., mm	15.88 × 25.4	22.33 × 38.1	31.75 × 50.8
Max. Screw Size	M15	M22	M31

Shims



Shims are stamped with the thickness and may be mildly magnetic. Maximum Rockwell hardness is C45.

Shims

Shims are not rated for hardness.

Aluminum shims are painted Alloy 1100, 1200, or 3003. They are lightweight, rust resistant, and stronger than plastic slotted shims. **Plastic** shims are polyester and withstand oil. Maximum temperature is 140° F.

Horseshoe Shims

Designed to fit around screws, these shims are commonly used in window, door, and cabinet installations. Thickness tolerance is ±0.032″.

316 stainless steel shims have excellent corrosion resistance and may be mildly magnetic. Rockwell hardness is B83.

Color-coded plastic shims let you identify thickness by color: 0.063″ thick are blue; 0.125″ thick are red; and 0.250″ thick are black. They are not rated for temperature or hardness. *Color-coded interlocking plastic* shims have ridges that hold them together when stacked.

Adjustable-length plastic shims are scored so you can shorten them. Color is black. They are not rated for temperature or hardness.

About Spacers and Standoffs

Unthreaded Spacer

Threaded Standoff

Use spacers and standoffs to position components in assemblies, as well as to separate or connect parts. **Spacers** are unthreaded. **Standoffs** are threaded. *Hex standoffs* have flat sides that ensure a firm grip when tightened with a wrench.

Inch sizes have a Class 2A or 2B thread fit. **Metric sizes** have a Class 6H or 6g thread fit.

Stainless steel is strong, electrically conductive, and nonmagnetic. *316 stainless steel* has excellent corrosion resistance. Tensile strength is 70,000 psi and Rockwell hardness is B80. *18-8 stainless steel* has good corrosion resistance. Tensile strength is at least 75,000 psi and Rockwell hardness is B60.

Brass is strong, corrosion resistant, electrically conductive, and nonmagnetic. Tensile strength is 45,000 psi. Rockwell hardness is B55. *Zinc plating* adds corrosion resistance.

Aluminum is lightweight and mildly resistant to corrosion. Tensile strength is 45,000 psi. Rockwell hardness is B50.

Steel is strong. *1006-1010 steel* is not rated for tensile strength or hardness. *12L14-1215 steel* have a tensile strength of 55,000 psi. Rockwell hardness is B40. *Zinc plating* adds corrosion resistance. *Nickel-chrome plating* adds a tarnish-resistant mirror-like finish.

Nylon 6/6 is nonconductive and resists chemicals and solvents (except mineral acids). It absorbs moisture, which can affect dimensions and other properties. Temperature range is –20° to 155° F. Not rated for tensile strength or hardness.

LDPE (low density polyethylene) is nonconductive and resists moisture and chemicals. Tensile strength is 1,000 psi. Hardness is Rockwell D40. Temperature range is –60° to 175° F.

Polypropylene is nonconductive and resists chemicals. Tensile strength is 3,000 psi. Rockwell hardness is R80. Temperature range is –40° to 160° F.

Acetal is strong and resists wear and chemicals. Tensile strength is 10,000 psi. Temperature range is –55° to 250° F. Not rated for hardness.

Fiberglass-reinforced plastic is voltage rated and resists impact and corrosion. Tensile strength is 1,000 psi. It is not rated for hardness or temperature.

Rubber compresses between components to dampen vibration, shock, and noise. Tensile strength is 1,000 psi. Durometer is 56A. Temperature range is 55° to 105° F. *Fabric-reinforced rubber* has a durometer of 90A and a temperature range of –65° to 200° F. It is not rated for tensile strength.

Garolite is G-10/FR4. It's strong and a good electrical insulator with low moisture absorption. Tensile strength is 35,000 psi. Rockwell hardness is M110. Temperature range is 0° to 300° F.

Fiber is lightweight and a good electrical insulator. It resists most organic solvents and petroleum-based oils. Tensile strength is 6,000 psi. Rockwell hardness is R60. Temperature range is 50° to 225° F.

Ceramic is Grade L5. It is a good electrical insulator and withstands high voltages and high temperatures. Tensile strength is 9,000 psi. Hardness is Mohs 7.5. Temperature range is 50° to 1700° F. *Glazed finish* reduces moisture absorption.

Unthreaded Spacers

These spacers are also known as clearance spacers. Spacers have an OD tolerance of ±0.005″, ID tolerance of +0.01″, and length tolerance of ±0.005″, except nylon. Nylon 6/6 spacers have an OD tolerance of ±0.015″ for 1/8″ to 1″ ODs and ±0.02″ for 1 1/2″ OD. ID tolerance is -0.005″ to +0.015″. Length tolerance is ±0.015″ for 1/16″ to 1 7/16″ lengths and ±0.03″ for 1 1/2″ to 2 1/2″ lengths.

18-8 stainless steel spacers meet ASTM A581 or A582. **Zinc-plated brass** spacers meet ASTM B16. **Black-anodized aluminum** spacers meet MIL-A-8625F, Type II, Class 2. **Zinc-plated steel** spacers are 12L14-1215 steel. **Nylon 6/6** spacers are off-white.

(Continued on following page)

Unthreaded Spacers *(Continued from previous page)*

These spacers are also known as clearance spacers. Spacers have an OD tolerance of ±0.005″, ID tolerance of +0.01″, and length tolerance of ±0.005″, except nylon. Nylon 6/6 spacers have an OD tolerance of ±0.015″ for 1/8″ to 1″ ODs and ±0.02″ for 1 1/2″ OD. ID tolerance is –0.005″ to +0.015″. Length tolerance is ±0.015″ for 1/16″ to 17/16″ lengths and ±0.03″ for 1 1/2″ to 2 1/2″ lengths.

18-8 stainless steel spacers meet ASTM A581 or A582. **Zinc-plated brass** spacers meet ASTM B16. **Black-anodized aluminum** spacers meet MIL-A-8625F, Type II, Class 2. **Zinc-plated steel** spacers are 12L14-1215 steel. **Nylon 6/6** spacers are off-white.

Plastic Unthreaded Spacers

LDPE

Polypropylene and Acetal

These spacers are also known as clearance spacers.

LDPE spacers have OD and ID tolerances of ±0.015″ for 3⁄16″ to 1⁄2″ ODs and ±0.025″ for 3⁄4″ to 1″ ODs. Length tolerance is ±0.062″ for 3⁄16″ to 2″ lengths and ±0.09″ for 2 1⁄2″ to 6″ lengths.

Polypropylene spacers have OD and ID tolerances of ±0.015″ for 1⁄4″ to 3⁄8″ ODs and ±0.025″ for 1⁄2″ to 1″ ODs. Length tolerance is ±0.062″.

Acetal spacers have OD and length tolerances of ±0.01″. ID tolerance is +0.01″. Meet ASTM D4181 and D6778.

Unthreaded Spacer Stock

Cut stock to the length you need.

Polypropylene spacer stock has an OD tolerance of ±0.015″, ID tolerance of +0.03″, and length tolerance of ±0.062″.

Aluminum spacer stock has an OD tolerance of ±0.003″, ID tolerance of +0.01″, and length tolerance of ±0.005″.

Slotted Unthreaded Spacers

An economical alternative to standard unthreaded spacers. Made of zinc-plated 1006-1010 steel. ID tolerance is +0.006″ for 0.144″ ID and +0.008″ for 0.172″ to 0.260″ IDs. Length tolerance is ±0.005″. OD tolerance is not rated.

Electrical-Insulating Unthreaded Spacers

Garolite spacers are G-10/FR4. They have a dielectric strength of 400 V/mil. OD and ID tolerances are ±0.005″. Length tolerance is ±0.013″. Meet MIL-I-24768/27.

Ceramic spacers are Grade L5 and have an unglazed finish. They have a dielectric strength of 275 V/mil. OD, ID, and length tolerances are ±0.01″.

Fiber spacers have a dielectric strength of 75 V/mil. OD tolerance is ±0.02″, ID tolerance is +0.02″, and length tolerance is ±0.062″.

Vibration-Damping Unthreaded Spacers

These spacers compress between components to reduce vibration, shock, and noise. They are made of oil-resistant, fabric-reinforced black rubber. OD, ID and length tolerances are ±0.031″.

OD	For Screw Size	ID	Lg.		Each
1/2″	No. 12	1/4″	1″	99025A120	$15.20

Unthreaded Spacers for Angles

The 45° end of these spacers fits against angled surfaces to create a flat surface for connection. OD and ID tolerances are ±0.01″. Length tolerance is ±0.02″.

To Order: Please specify 316 stainless steel, 12L14 steel, or white nylon 6/6.

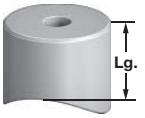
Unthreaded Spacers for Tubes



Also known as saddle washers, the curved end of these spacers fits against round objects such as tubes and pipe. Spacers are off-white nylon 6/6. OD and length tolerances are ±0.015″. ID tolerance is ±0.005″.

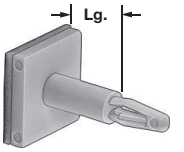
Adhesive-Back Unthreaded Spacers



The acrylic adhesive back lets you stick these spacers to surfaces where you don't want to drill a hole. Spacers are white nylon 6/6 with a 1/2″ Lg. × 1/2″ Wd. base. Length tolerance is ±0.015″.

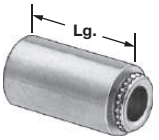
Press-Fit Unthreaded Spacers



Also known as captive spacers, these have splines that bite into your panel for a secure hold. Use a lever press for installation. The length does not include the splined portion. Spacers are 18-8 stainless steel and can be used with panels as thin as 0.06″. OD and length tolerances are ±0.005″. ID tolerance is ±0.004″. Hole diameter tolerance is +0.003″.

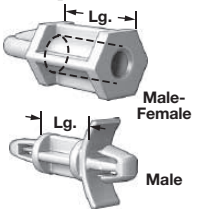
Snap-In Unthreaded Spacers



Snap these spacers into a hole, such as those on printed circuit boards. Spacers are off-white nylon 6/6 and can be used with 1/16″ thick panels. Length tolerance is ±0.015″.

Male-female spacers fit 5/32″ dia. holes. Secure with a No. 6 screw.

Male spacers have wings on the sides that add tension to strengthen the hold in the hole. Use in a 3/16″ dia. hole.

Female Threaded Round Standoffs

The smooth surface keeps your work looking clean and professional. Metal standoffs have OD and body length tolerances of ±0.005″, except zinc-plated brass standoffs have an OD tolerance of ±0.006″. Nylon 6/6 standoffs have OD and body length tolerances of ±0.01″. Standoffs are fully threaded, except the lengths listed in the chart, which are partially threaded.

18-8 stainless steel standoffs meet ASTM A581 or A582. **Zinc-plated brass** standoffs meet ASTM B16. **Zinc-plated steel** standoffs are 12L14 steel. **Nylon 6/6** standoffs are off-white.

Caps for Female Threaded Round Standoffs

Give open-ended standoffs an attractive appearance and protect them from dirt and debris. Thread length is ⅜″. Cap diameter and height are ¼″.

To Order: Please specify thread size: 4-40, 6-32, 8-32, or 10-32.

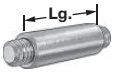
Male Threaded Round Standoffs



Standoffs are 18-8 stainless steel with a 4-40 male stud on each end. OD tolerance is -0.0005″; body length tolerance is ±0.005″. Not rated for hardness or tensile strength.

Male-Female Threaded Round Standoffs

A through hole lets you insert a rod for extra leverage during tightening. Standoffs are 18-8 stainless steel with an 8-32 male stud on one end and a 1/4″-20 female threaded hole on the other. Male thread length is 3/16″; minimum female thread length is 9/32″. OD tolerance is -0.002″; body length tolerance is ±0.005″. Not rated for hardness or tensile strength.

Pillar Posts

Often used to build mounts for optical components. A through hole lets you insert a rod for extra leverage during tightening. Made of 18-8 stainless steel. Thread size is 1/4″-20. Minimum thread length is 3/8″, except posts with 1/2″ and 3/4″ lengths are fully threaded. OD tolerance is -0.001″; body length tolerance is ±0.001″. Not rated for hardness or tensile strength.

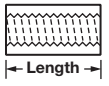
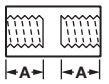
Female Threaded Hex Standoffs





Tighten standoffs with a wrench. The flat sides of the hex ensure a firm grip. Standoffs have a hex size tolerance of ±0.006″ and a hex length tolerance of ±0.005″, except nylon 6/6 standoffs have hex size and hex length tolerances of ±0.01″. Standoffs are fully threaded, except the lengths listed in the chart, which are partially threaded.

18-8 stainless steel standoffs meet ASTM A582. **Zinc-plated brass** standoffs meet ASTM B16. **Zinc-plated steel** standoffs are 12L14 steel. **Nylon 6/6** standoffs are off-white.

Metric Female Threaded Hex Standoffs

Tighten standoffs with a wrench. The flat sides of the hex ensure a firm grip. Hex size and hex length tolerances are ±0.013 mm. Standoffs are fully threaded, except the lengths listed in the chart, which are partially threaded.

18-8 stainless steel standoffs meet ASTM A581 or A582. **Zinc-plated brass** standoffs meet ASTM B16.

Thread Size	*Partially Threaded Lengths* 18-8 Stainless Steel	Brass and Aluminum	Min. Thread Length (A)

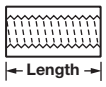
Electrical-Insulating Female Threaded Standoffs

Round Ceramic

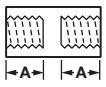
Round Plastic

Hex

Octagon



Fully Threaded



Partially Threaded

Use these electrical-insulating standoffs in high-voltage applications.

Ceramic standoffs withstand temperatures up to 1700° F. They have a glazed finish, which reduces moisture absorption. OD and body length tolerances are ±0.012″. Standoffs have a Class 1B thread fit. Dielectric strength is 275 V/mil. Not rated for voltage. Color is off-white.

Fiberglass-reinforced plastic standoffs resist impact and corrosion. OD and hex size tolerances are ±0.01″. Body length tolerance is ±0.015″. Dielectric strength is 350 V/mil. Not rated for temperature, unless noted. Color is red.

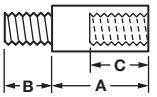
Metric Male-Female Threaded Hex Standoffs



Connect metric male threads to metric female threads. Both ends have the same size threads. Tighten standoffs with a wrench. The flat sides of the hex ensure a firm grip. Hex size and hex length tolerances are ±0.13 mm, except nylon 6/6 standoffs have hex size and hex length tolerances of ±0.26 mm.

18-8 stainless steel standoffs meet ASTM A581 or A582. **Zinc-plated brass** standoffs meet ASTM B16. **Nylon 6/6** standoffs are off-white.

Thread Size	*Thread Lengths* Male (B)	Female (C)

8 mm Hex Size—Choose a thread size: M3.5, M4, M5; material: 18-8 stainless steel, zinc-plated brass, or aluminum; and length: 5, 6, 8, 10, 12, 14, 16, 19, 20, 25, 30 mm. 93655A961

★ Prices are 15% lower when you buy in multiples of 10.

Male-Female Threaded Hex Standoffs

Connect inch male threads to inch female threads. Both ends have the same size threads. Tighten standoffs with a wrench. The flat sides of the hex ensure a firm grip. Metal standoffs have hex and hex length tolerances of ±0.006″, except zinc-plated steel standoffs have hex and hex length tolerances of ±0.005″. Nylon 6/6 standoffs have hex and hex length tolerances of ±0.015″.

18-8 stainless steel standoffs meet ASTM A581 or A582. **Zinc-plated brass** standoffs meet ASTM B16. **Zinc-plated steel** standoffs are 12L14 steel. **Nylon 6/6** standoffs are off-white.

Press-Fit Female Round Standoffs

These standoffs, often called captive standoffs, won't push, pull, or twist out once installed. Use a lever press for installation (sold separately on pages 2348-2349). Made of 18-8 stainless steel.

(A&B) Clinch style standoffs have a recess under the hex that pinches the panel for a secure hold. When mounted, the hex sits flush with the surface. Length includes hex. Length tolerance is +0.002″, -0.005″. Body OD tolerance is -0.005″. Not rated for hardness.

(C) Splined style standoffs bite into the panel. Length does not include the splines. Length and body OD tolerances are ±0.005″. Standoffs meet ASTM A582.

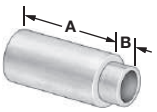
Crimp-On Female Threaded Round Standoffs



Often called swage standoffs because you permanently crimp them into a panel. Use a punch and anvil for installation. Made of zinc-plated brass. Body has a 1/4″ OD. Body OD and length tolerances are ±0.005″. Crimp end has a 0.188″ OD; tolerance is -0.003″. Standoffs are fully threaded.

Also Available: Punch and anvil for installation. For punch, please ask for 93500A555 and specify body length. For anvil, please ask for 93500A888 and specify body length.

Male-Female Threaded Jack Screws

Use jack screws to secure your computer and telephone panels. Each screw comes with two flat washers, a lock washer, and a hex nut. Made of zinc-plated 12L14 steel. Thread size is 4-40. Hex size and hex length are 3/16″. Hex size and length tolerances are ±0.005″. Minimum female thread length is 0.1″.

Also Available: Screw only. Please ask for 92710A555 and specify thread length.

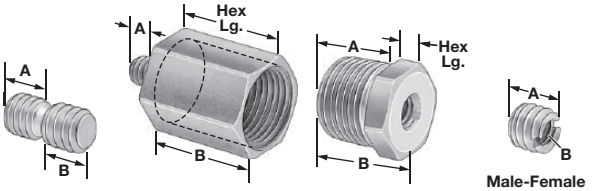
Brass Thread Adapters



The through hole allows you to connect float rods to float valves. Adapters are brass, which has good strength and corrosion resistance. Inch threads have a Class 2A or 2B thread fit; metric have Class 6g. Not rated for tensile strength. Not rated for hardness, except male round and male-female round slotted-drive adapters, which have a Rockwell hardness of B70.

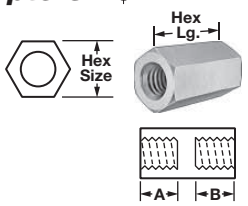
Female Hex Thread Adapters



Female thread adapters, often called reducing coupling nuts, connect different sizes of threaded rod. Inch sizes have a Class 2B thread fit. Metric sizes have a Class 6H thread fit. Not rated for tensile strength.

18-8 stainless steel thread adapters have good corrosion resistance. Rockwell hardness is B55.

Zinc-plated steel thread adapters are strong and corrosion resistant. Rockwell hardness is B65.

Left-Hand to Right-Hand Female Hex Thread Adapters

Often called sleeve nuts, thread adapters fasten parts with right-hand threads to parts with left-hand threads. Thread size and thread length are the same for both ends. Thread adapters have a Class 2B thread fit. Not rated for tensile strength.

18-8 stainless steel adapters have good corrosion resistance. Rockwell hardness is B80.

Zinc-plated steel adapters are strong and corrosion resistant. Rockwell hardness is B65.

Male Hex Thread Adapters

Make a secure connection between female threads. Adapters are 18-8 stainless steel, which has good corrosion resistance. Inch threads have a Class 2A thread fit; metric threads have Class 6g. Tensile strength is 85,000 psi. Rockwell hardness is B80.

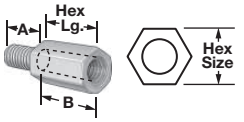
Male-Female Hex Thread Adapters



Connect male and female threads of different sizes. Adapters are 18-8 stainless steel, which has good corrosion resistance. Inch male threads have a Class 2A thread fit; female have Class 2B. Metric male threads have a class 6g thread fit; female have class 6H. Tensile strength is 85,000 psi. Rockwell hardness is B80. Adapters meet ASTM A582.

Also Available: Heat treated steel adapters in sizes marked with a ♣. Please ask for 94402A770 and specify male and female screw sizes.

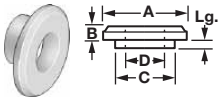
Unthreaded Shoulder Spacers with Flange



Also known as insulator or shoulder washers, shoulder spacers insulate and protect screws, wire, and tubing from corrosion.

250-Piece Off-White Nylon 6/6 Assortment

Includes spacers in a variety of barrel lengths for the following screw sizes: 40 for No. 2, 50 for No. 4, 30 for No. 6, 45 for No. 8, 40 for No. 10, 30 for 1/4″, and 15 for 5/16″. Furnished in a plastic box.

90062A600 ..... $35.62

Panel Standoffs

Give mounted glass and other display panels an updated look. Standoffs are aluminum and include a barrel, cap, and set screw.

Round standoffs have a 5/16″-18 mounting thread. Mounting hardware is sold separately. **Square** standoffs include a threaded stud for mounting.

Round

Also Available: Square aluminum standoffs with a black anodized finish. Please ask for 92082A555 and specify square size and length.

Mounting Hardware for Round Standoffs

Toggle bolt anchors include one steel headless toggle bolt. Use in wallboard up to 3/4″ thick. 94706A992 requires a 1/2″ dia. hole; 94706A990 requires a 7/8″ dia. hole.

Threaded anchors include one steel threaded stud.

For Use On	For Standoff OD	O'all Lg.

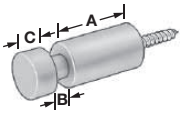
Peg-Style Panel Standoffs

Use four standoffs to mount panels, or use a single standoff as a decorative hook. Each comes with a wall anchor and a No. 10 × 13/16″ mounting screw.

Aluminum standoffs have a brushed finish. **Acrylic** standoffs are translucent with a frosted finish and have a maximum temperature of 120° F.



Max. Panel Thick.	OD	(A)	(B)	(C)	Acrylic	Aluminum	Pkg. of 4
1/4″	7/8″	1 5/16″	5/16″	3/8″	99656A500	99656A100	$29.04

Edge-Grip Panel Standoffs

Hang display panels without drilling into them. Standoffs are aluminum. Each includes a barrel with a nylon-tipped set screw under a removable cap. Tighten the set screw to hold panel in place. Use optional mounting hardware (sold separately) to mount into wallboard and wood.

Standoffs

Max. Panel Thick.	(A)	(B)	(C)

Press-Fit Bolt Liners

Reinforce bolt holes with zinc-plated steel split-seam liners.

Liners **for metal** protect bolts from sideways pressure and have beveled ends to aid insertion. Minimum Rockwell hardness is C45. Liners **for plastic**, also known as compression limiters, keep plastic components from getting crushed when bolts are tightened. They have straight ends. Minimum Rockwell hardness is C40.

External Retaining Rings

1/8" to 15/64"

1/4" to 10"

Pull rings open to pass over the end of a shaft and release to spring into the groove. They meet ASME B18.27.1 and are magnetic.

Black-finish and ***zinc and yellow chromate-plated steel*** rings have a minimum Rockwell hardness of C40. ***Stainless steel*** rings are made of Type 15-7 or 17-7 PH stainless steel. Minimum Rockwell hardness is C43.

Nonmagnetic External Retaining Rings

Made of beryllium copper, rings are nonmagnetic, corrosion resistant, and electrically conductive. They meet ASME B18.27.1. Minimum Rockwell hardness is C36 for shaft diameters 5/16" and larger (1/8"-1/4" shaft diameters are not rated).

Metric External Retaining Rings

Rings meet DIN 471. ***Black-finish steel*** rings have a minimum Rockwell hardness of C44. ***Stainless steel*** rings are made of DIN 1.4122 stainless steel, which has similar properties to 400 series. They are magnetic and have a minimum Rockwell hardness of C47.

Mil. Spec. External Retaining Rings

Meets stringent military specification MS 16624.

Cadmium-plated steel rings have better corrosion resistance than zinc. Minimum Rockwell hardness is 45N 52 for shaft diameters up to 1.5″ and C46 for shaft diameters 1.625″ and larger.

Stainless steel rings are made of Type 15-7 PH stainless steel, which is more corrosion resistant than cadmium-plated steel. They're magnetic and passivated in accordance with QQ-P-35. Minimum Rockwell hardness is 30N 63 for shaft diameters up to 0.812″ and C44 for shaft diameters 0.875″ and larger.

Heavy Duty External Retaining Rings

Rings are thicker than standard external retaining rings. They meet ASME B18.27.2.

Black-finish steel rings have a minimum Rockwell hardness of C47. ***Stainless steel*** rings are made of Type 15-7 or 17-7 PH stainless steel, which is magnetic. Minimum Rockwell hardness is C44.

Spiral External Retaining Rings

Install these coiled rings by winding them into the groove on a shaft. No tools are required for installation so they're ideal for tight spaces. Rings have 360° contact with the shaft so there is no gap. Not rated for hardness.

Stainless steel rings are made of 18-8 stainless steel and may be mildly magnetic.

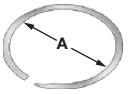
Easy-to-Install Spiral External Retaining Rings



Also called single-turn rings, install by sliding them into the groove on a shaft with one twist. Thinner than standard rings, they fit into smaller grooves. They are not rated for hardness.

Stainless steel rings are made of 18-8 stainless steel and may be mildly magnetic.

Self-Locking External Retaining Rings

No groove required for installation. Rings dig in to the shaft material, so expect minor scratching. Use with an unhardened shaft. They're tougher to remove compared to standard retaining rings.

Black-finish steel rings have a minimum Rockwell hardness of C47 for shaft diameters 1/4" and larger (3/32"-3/16" shaft diameters are not rated).

Stainless steel rings are made of Type 15-7 or 17-7 PH stainless steel, which is magnetic. Minimum Rockwell hardness is C44 for shaft diameters 1/4" and larger (3/32"-3/16" shaft diameters are not rated).

Metric External Clips

Slide clip into a groove that is near the end of the shaft. A tab locks them into place. Lift the tab to remove. They are made of black-finish steel and have a minimum Rockwell hardness of C40.

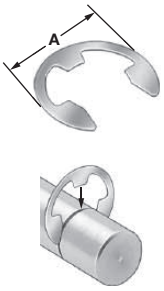
Side-Mount External Retaining Rings (E-Style)



Snap rings into the groove from the side of the shaft. Their three prongs make contact with the shaft and provide a wider shoulder than other external retaining rings for a larger retaining surface. They are magnetic.

Black-finish and ***zinc and yellow chromate-plated steel*** rings have a minimum Rockwell hardness of C47. ***Stainless steel*** rings are made of Type 15-7 or 17-7 PH stainless steel. Minimum Rockwell hardness is C44.

Also Available: Nonmagnetic beryllium copper rings in sizes marked with a ♦. Please ask for 92725A500 and specify shaft diameter.

Metric Side-Mount External Retaining Rings (E-Style)

Rings meet DIN 6799. They snap directly into the groove from the side of the shaft. The three prongs make contact with the shaft and provide a wider shoulder than other external retaining rings. They are magnetic.

Black-finish steel rings have a minimum Rockwell hardness of C46. ***Stainless steel*** rings are made of DIN 1.4122 stainless steel, which has similar properties to 400 series. Minimum Rockwell hardness is C44, unless noted.

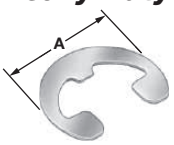
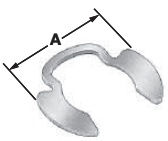
Heavy Duty Side-Mount External Retaining Rings



Style 1



Style 2

Rings are wider than our standard side-mount retaining rings to provide a larger retaining surface.

Black-finish steel rings have a minimum Rockwell hardness of C47. ***Stainless steel*** rings are made of Type 15-7 or 17-7 PH stainless steel. They have a minimum Rockwell hardness of C43 and are magnetic.

Style 1 rings are interchangeable with standard side-mount (E-style) rings and meet ASME B18.27.2. ***Style 2*** rings, also known as clip or poodle rings, are thicker and have wide "ears" that form an extra-wide retaining surface.

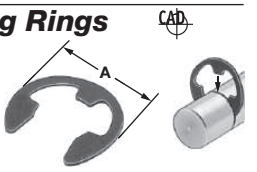
Bowed Side-Mount External Retaining Rings



Also known as bowed E-style rings, their concave design provides spring-like retention for a tight hold. They snap directly into the groove from the side of the shaft. Rings are made of steel and have a black finish. They meet ASME B18.27.3. Minimum Rockwell hardness is C47, except 1/8" shaft diameter is not rated.

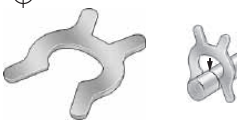
Crimp-On External Retaining Rings



Commonly called X-washers, install these rings using any standard pliers. Place into the groove and squeeze tight to form a 360° closure. To remove, squeeze tabs on the opposite side of the opening.

Zinc-plated steel rings have a Rockwell hardness of B60. ***Stainless steel*** rings are made of 18-8 stainless steel, which may be mildly magnetic. Minimum Rockwell hardness is B82.

Side-Mount External Retaining Ring Assortments

Assortments come in a compartmented plastic box with lid chart, unless noted.

225-Piece Low-Clearance Black-Finish Steel— 9 sizes for shaft diameters: 7/32", 1/4", 9/32", 5/16", 3/8", 7/16", 1/2", 5/8", and 3/4".

98555A070 ..... $46.88

265-Piece E-Style— 12 sizes for shaft diameters: 1/8", 5/32", 3/16", 7/32", 1/4", 5/16", 3/8", 7/16", 1/2", 5/8", 3/4", and 7/8".

Zinc and Yellow Chromate-Plated Steel.. 98554A060 $37.11
Stainless Steel..... 98460A212 142.93

300-Piece Metric E-Style Black-Finish Steel— 12 sizes for shaft diameters: 3 mm, 4 mm, 5 mm, 6 mm, 7 mm, 8 mm, 9 mm, 10 mm, 11 mm, 13 mm, 16 mm, and 20 mm.

98554A660 ..... $30.85

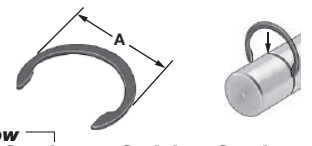
555-Piece E-Style Zinc and Yellow Chromate-Plated Steel— 18 sizes for shaft diameters: 1/8", 5/32", 3/16", 7/32", 1/4", 5/16", 3/8", 7/16", 1/2", 5/8", and 3/4", plus heavy duty steel rings for shaft diameters: 3/16", 7/32", 1/4", 5/16", 3/8", 7/16", and 1/2".

98554A070 ..... $72.40

1,500-Piece E-Style Black-Finish Steel— 19 sizes for shaft diameters: 1/16", 3/32", 7/64", 1/8", 9/64", 5/32", 11/64", 3/16", 7/32", 1/4", 5/16", 3/8", 7/16", 1/2", 5/8", 3/4", 7/8", 63/64", and 1 3/16". Comes in a plastic carrying case that holds four boxes.

98554A090 ..... $85.31

Low-Clearance Side-Mount External Retaining Rings



Also known as crescent rings, these are ideal where space and access is limited and a large shoulder is not required. They meet ASME B18.27.2.

Black-finish steel and ***zinc and yellow chromate-plated steel*** have a minimum Rockwell hardness of C47 for shaft diameters 7/32" and larger (shaft diameters 1/8"-3/16" are not rated).

Stainless steel rings are Type 15-7 or 17-7 PH and magnetic. Minimum Rockwell hardness is C43 for shaft diameters 7/32" and larger (shaft diameters 1/8"-3/16" are not rated).

Internal Retaining Rings

Compress rings into the groove inside a bore or housing. Once installed, they provide a shoulder to hold components in place. All rings meet ASME B18.27.1 and are magnetic.

Black-finish and ***zinc and yellow chromate-plated steel*** rings have a minimum Rockwell hardness of C40. ***Stainless steel*** rings are made of Type 15-7 or 17-7 PH stainless steel. Minimum Rockwell hardness is C43.

Also Available: Nonmagnetic beryllium copper rings in sizes marked with a ♣. Please ask for 91482A100 and specify bore diameter.

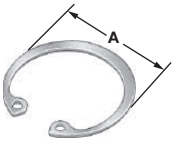
Metric Internal Retaining Rings



Rings meet DIN 472. Compress rings into the groove of a bore or housing. Once installed, they provide a shoulder to hold components in place.

Black-finish steel rings have a minimum Rockwell hardness of C44. ***Stainless steel*** rings are made of DIN 1.4122 stainless steel, which has similar properties to 400 series and is magnetic.

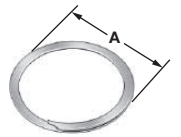
Spiral Internal Retaining Rings



Wind these rings into the groove inside a bore or housing to form 360° contact with the shaft. Not rated for hardness.

Stainless steel rings are made of 18-8 stainless steel and may be mildly magnetic.

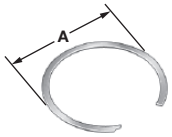
Easy-to-Install Spiral Internal Retaining Rings



Install with one twist into the groove inside a bore or housing. Also called single-turn rings, they are thinner than standard retaining rings. They are not rated for hardness.
Stainless steel rings are made of 18-8 stainless steel and may be mildly magnetic.

Self-Locking Internal Retaining Rings

No groove required for installation. Rings dig into the shaft material, so expect minor scratching. Use with an unhardened shaft. They're tougher to remove compared to other retaining rings. Rings for bore diameters 5⁄16″-⅝″ are 0.01″ thick; ¾″ and larger rings are 0.015″ thick.
Black-finish steel rings have a minimum Rockwell hardness of C47. ***Stainless steel*** rings are made of Type 15-7 or 17-7 PH stainless steel, which is magnetic. Minimum Rockwell hardness is C44.

Internal Retaining Ring Assortments

150-Piece Zinc and Yellow Chromate-Plated Steel—12 sizes for bore diameters: ¼″, ⅜″, ½″, ⅝″, ¾″, ⅞″, 1″, 1⅛″, 1¼″, 1½″, 1⅝″, and 1¾″.

98553A050 ..... $39.95

180-Piece Stainless Steel—12 sizes for bore diameters: ¼″, 5⁄16″, ⅜″, 7⁄16″, ½″, 9⁄16″, ⅝″, ¾″, ⅞″, 1″, 1⅛″, and 1¼″.

91605A212 ..... $232.62

240-Piece Metric Black-Finish Steel—12 sizes for bore diameters: 8 mm, 9 mm, 10 mm, 11 mm, 12 mm, 14 mm, 16 mm, 18 mm, 20 mm, 24 mm, 28 mm, and 32 mm.

98365A260 ..... $84.37

261-Piece Black-Finish Steel—20 sizes for bore diameters: ¼″, ½″, ⅝″, 11⁄16″, ¾″, ⅞″, 1″, 1⅛″, 1¼″, 1⅜″, 1⁷⁄16″, 1½″, 1⁹⁄16″, 1⅝″, 1¾″, 1⅞″, 2″, 2⅛″, 2¼″, and 2½″.

98553A470 ..... $61.03

300-Piece Self-Locking Black-Finish Steel—12 sizes for bore diameters: 5⁄16″, ⅜″, 7⁄16″, 0.44″, ½″, 9⁄16″, ⅝″, ¾″, ⅞″, 15⁄16″, 1″, 1¼″.

98435A600 ..... $63.03

333-Piece Zinc and Yellow Chromate-Plated Steel—25 sizes for bore diameters: ⅜″, 7⁄16″, ½″, ⅝″, 11⁄16″, ¾″, 13⁄16″, ⅞″, 1″, 1¹⁄16″, 1⅛″, 1¼″, 1⅜″, 1½″, 1⅝″, 1¾″, 1⅞″, 2″, 2¼″, 2⅜″, 2½″, 2⅝″, 2¾″, 2⅞″, and 3″.

98553A060 ..... $74.91

395-Piece Zinc and Yellow Chromate-Plated Steel—24 sizes for bore diameters: ¼″, ⅜″, 7⁄16″, ½″, 9⁄16″, ⅝″, ¾″, 0.777″, 13⁄16″, ⅞″, 0.901″, 15⁄16″, 1″, 1.023″, 1¹⁄16″, 1⅛″, 1³⁄16″, 1¼″, 1⁵⁄16″, 1⅜″, 1⁷⁄16″, 1½″, 1⁹⁄16″, and 1⅝″. Includes one pair of internal pliers.

98411A660 ..... $141.72

Combined External/Internal Retaining Ring Assortments

126-Piece Zinc and Yellow Chromate-Plated Steel External/Internal—20 sizes; 60 external rings for shaft diameters: 15⁄16″, 1″, 1¹⁄32″, 1¹⁄16″, 1⅛″, 1³⁄16″, 1¼″, 1⁵⁄16″, 1⅜″, and 1⁷⁄16″, plus 66 internal rings for bore diameters: 1¹⁄16″, 1⅛″, 1³⁄16″, 1¼″, 1⁵⁄16″, 1⅜″, 1⁷⁄16″, 1½″, 1⁹⁄16″, and 1⅝″. Includes one pair of external/internal pliers.

98605A020 ..... $84.37

216-Piece Spiral—12 external rings and 12 internal rings for bore/shaft diameters: ½″, ⅝″, ¾″, ⅞″, 1″, 1⅛″, 1¼″, 1⅜″, and 1½″.

Steel ..... 91665A120 ... $114.53
Stainless Steel ..... 91650A200 ... 282.82

220-Piece External/Internal—20 sizes; 105 external rings for shaft diameters: ¼″, 5⁄16″, ⅜″, 7⁄16″, ½″, ⅝″, 11⁄16″, ¾″, ⅞″, and 1″, plus 115 internal rings for bore diameters: ⅜″, 7⁄16″, ½″, 9⁄16″, ⅝″, ¾″, ⅞″, 1″, 1⅛″, and 1¼″. Includes one pair of external/internal pliers.

Zinc and Yellow Chromate-Plated Steel ..... 98605A010 ... $84.91
Stainless Steel ..... 98645A220 ... 298.74

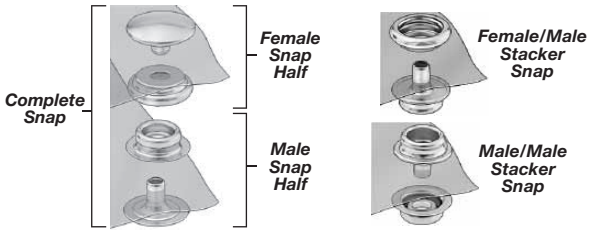
380-Piece Black-Finish Steel External/Internal and E-Style—22 sizes; 120 external rings and 120 internal rings for shaft diameters: 8 mm, 10 mm, 12 mm, 14 mm, 16 mm, 18 mm, and 20 mm, plus 140 E-style rings for shaft diameters 3 mm, 4 mm, 5 mm, 6 mm, 7 mm, 8 mm, 10 mm, and 12 mm. Includes one pair of external/internal pliers.

93352A100 ..... $151.45

1,000-Piece Black-Finish Steel External/Internal—20 sizes; 550 external rings for shaft diameters: ¼″, 5⁄16″, ⅜″, 7⁄16″, ½″, 9⁄16″, ⅝″, ¾″, ⅞″, 1″, and 1⅛″, plus 450 internal rings for bore diameters: ⅜″, 7⁄16″, ½″, 9⁄16″, ⅝″, ¾″, ⅞″, 1″, and 1⅛″. Also includes one pair of external pliers, one pair of internal pliers, and replacement tips.

98605A001 ..... $151.24

Fabric Snaps



Join leather, canvas, and other soft, heavy fabrics with these heavy duty 9/16″ diameter snaps. All snaps require a tool (sold separately on this page) to install. Use ***stacker snaps*** when you want to stack one snap on top of another. They require special dies (sold separately on this page) for installation.

Male Snap Halves for Solid Surfaces

When you need to fasten a fabric snap to a solid surface, pair one of these snap halves with a female snap half or a male/female stacker snap (sold separately on this page).

Threaded Stud-Style

All have a Phillips drive for easy installation.

Self Drilling— Use in steel, aluminum, and fiberglass. Choose from ***Type 410 SS screws*** (may be magnetic), and ***18-8 SS screws*** (mildly magnetic).

Tapping— For drilled holes in wood, metal, and fiberglass.

Machine Screw— For threaded holes in metal and fiberglass.

Blind-Rivet Style

Fasten a snap to a solid surface when you only have access to one side. The snap is nickel-plated brass; the mandrel is 18-8 stainless steel. Requires a 1/8″ diameter drilled hole and a blind rivet tool for installation.

For Material Thickness	Pkg. Qty.		Pkg.
1/8″ to 3/16″	25	95707A688	$9.17
3/16″ to 3/8″	25	95707A687	10.40

Fabric Snap and Tool Kits

Repair tarps, tents, and awnings with one convenient kit. Each kit includes a hand punch tool with a die, and six complete 9/16″ diameter nickel-plated brass snaps.

The fabric-to-wood kit has #7 x 5/8″ tapping screw studs to attach fabric to wood or similar materials.

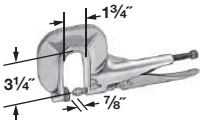
Replacement snaps include six complete snaps.

	Snap and Tool Kits		Replacement Snaps	
Fabric-to-Fabric	95730A210	$7.67	95730A320	$4.67
Fabric-to-Wood	95730A230	9.38	95730A440	6.55

Installation Tools for Fabric Snaps

All the tools you need to swiftly install 9/16″ dia. fabric snaps.

Hand Press and Dies



Squeeze the adjustable pliers-grip handle to easily install snaps. Made of aluminum. Comes with a 4-piece die set to install male and female snap halves. *Note:* Also installs grommets (see page 3870 for grommets and dies).

Hand Press	95720A690		$159.35
Die for Stacker Snaps	95720A350		47.74
Replacement 4-Pc. Die Set	95720A692		103.23

Hand Punch and Dies

Strike the punch with a mallet to set snaps. Made of stainless steel. Dies are sold separately.

Hand Punch	95710A690		$15.28
Die for Female Snap Halves	95710A696		12.05
Die for Male Snap Halves	95710A698		12.05

Bench-Mount Press and Dies

Install snaps with one easy push. Made of iron, it has a deep throat and a long padded handle. Dies are sold separately. The *4-piece die set* installs male and female snap halves.

Bench-Mount Press	95715A690		$277.45
4-Pc. Die Set	95715A692		222.48
Die for Stacker Snaps	95715A360		76.58

Locking Hammer-Set Fabric Snaps

Also known as slam rivets. Use a hammer to lock these two-piece snaps together. Snaps must be destroyed to be removed.

Cap Dia.	Max. Material Thickness	Pkg. Qty.		Pkg.

Hand Driver for Screw Stud	95678A695	Each	20.19

About Threaded Inserts

Repair stripped threads or convert existing threads between inch and metric sizes.

Inserts for Metal

Helical inserts repair threads while removing less material than other threaded inserts. **Key-locking** and **thread-locking** inserts install into a tapped hole. **Tapping** inserts cut their own threads so you don't have to tap the hole.

Helical
pgs. 3316-3322

Key Locking
pgs. 3322-3324

Tapping
pgs. 3324-3325

Thread Locking
pgs. 3325-3327

Inserts for Plastic and Wood

Add threads to material that is too weak to tap. **Press-fit** inserts are pressed into a drilled hole. **Heat-set** inserts are inserted into plastic; the plastic softens when heated during installation, then it cools to solidify around the insert's knurls and ridges to resist torque and pull-out. **Tapping** inserts cut threads into materials for excellent pull-out resistance. **Hammer-in** inserts have a flange that distributes the load over a large area.

Press Fit
pg. 3328

Heat Set
pg. 3329

Tapping
pgs. 3328; 3330

Hammer In
pgs. 3330-3331

Inserts for Thin Materials

Add threads to material that is too thin to accept an insert. **Rivet nuts** collapse and flare during installation to create a backside flange that grips the material and holds them in place. **Press-in nuts** have knurls on the bottom of the nuts to hold them firmly in place when pressed into panels. **Weld nuts** are welded to metal surfaces for a permanent hold. **Clip-on nuts** slide onto panels for a tight hold.

Rivet Nuts
pgs. 3332-3335

Press-In Nuts
pgs. 3237-3238

Weld Nuts
pg. 3240

Clip-On Nuts
pgs. 3238-3239

How to Install Helical Inserts

Drill a hole using the suggested drill bit size. Thread the hole with a tap (sold separately), then screw the insert onto the installation tool (see pages 3320-3321 for tools). The prong (tang) the tool grips during installation must be properly engaged in the tool's driving contour. Install the insert a quarter to half turn below the surface of the hole. Remove the prong to allow full passage of your screw into the insert.

Helical Inserts

Also known as Heli-Coil inserts, use these to repair threads in metals. The coils expand once installed to securely anchor the insert. Made from 18-8 stainless steel. Minimum tensile strength is 200,000 psi.

Standard inserts in inch sizes meet MS-122 or MS-124 except sizes 1-64, 12-24, 1 1/4″-8, 1 1/2″-8, 1 3/4″-8, left-hand thread, and NPT.

Screw-lock inserts have a polygon-shaped coil to securely hold screws and resist loosening. Inch sizes meet Mil. Spec. 21209 except sizes 1-64 and 1″-14.

Also Available: Lubricated inserts that have a dry film to avoid sticking during installation. Please ask for 91000A555 for standard inserts and 91000A888 of screw-lock inserts, then specify thread size and length.

Taps are for start-to-finish tapping of through-holes. **Also Available:** Taps for closed-end hole threading. Please ask for 91709A555 and specify thread size.

Standard inserts with tool include a tap for through-hole threading, an installation tool, and a drill bit (unless noted).

(Continued on following page)

Helical Inserts *(Continued from previous page)*

Also known as Heli-Coil inserts, use these to repair threads in metals. The coils expand once installed to securely anchor the insert. Made from 18-8 stainless steel. Minimum tensile strength is 200,000 psi.

Standard inserts in inch sizes meet MS-122 or MS-124 except sizes 1-64, 12-24, 1¼″-8, 1½″-8, 1¾″-8, left-hand thread, and NPT.

Screw-lock inserts have a polygon-shaped coil to securely hold screws and resist loosening. Inch sizes meet Mil. Spec. 21209 except sizes 1-64 and 1″-14.

Also Available: Lubricated inserts that have a dry film to avoid sticking during installation. Please ask for 91000A555 for standard inserts and 91000A888 of screw-lock inserts, then specify thread size and length.

Taps are for start-to-finish tapping of through-holes. **Also Available:** Taps for closed-end hole threading. Please ask for 91709A555 and specify thread size.

Standard inserts with tool include a tap for through-hole threading, an installation tool, and a drill bit (unless noted).

Helical Insert Assortments

Assortments include various sizes of helical inserts, a tap for through-hole threading, a drill bit, and an installation tool.

Coarse Thread—54 inserts. Sizes: 1/4″-20×0.375″, 5/16″-18×0.469″, 3/8″-16×0.563″, 7/16″-14×0.656″, 1/2″-13×0.750″, and 5/8″-11×0.938″.

90285A121 $441.98

Fine Thread—60 inserts. Sizes: 10-32×0.285″; 1/4″-28×0.375″, 5/16″-24×0.469″, 3/8″-24×0.563″, 7/16″-20×0.656″, and 1/2″-20×0.750″.

90285A124 $423.77

Miniature Thread—144 standard inserts and 144 screw-lock inserts, 24 each in sizes: 1-64×0.110″, 2-56×0.129″, 3-48×0.148″, 4-40×0.168″, 6-32×0.207″, and 8-32×0.246″.

90285A134 $500.04

Metric Thread—48 inserts. Sizes: M5×0.8 in 7.5 mm Lg., M6×1 in 9 mm Lg., M8×1.25 in 12 mm Lg., and M10×1.5 in 15 mm Lg.

90285A131 $233.27

Spark Plug Thread Repair Kits

Kits include helical inserts, a combination drill bit and tap, and an installation tool.

30-Pc. M14×1.25 mm Helical Insert Assort.—Has 30 inserts, six each of 0.375″, 0.438″, 0.472″, 0.500″, and 0.750″ lengths.

91732A091 $232.98

24-Pc. M18×1.5 mm Helical Insert Assort.—24 inserts, 0.500″ long.

91732A055 $260.09

3-Pc. M14×1.25 mm Helical Insert Assort.—Has three inserts (short, normal, and long reach). Use to repair gasket-seat and taper-seat spark plug ports.

91732A095 $53.12

18-Pc. M14×1.25 mm Helical Insert Assort.—Has 18 inserts (six each of short, normal, and long reach). Use to repair gasket-seat and taper-seat spark plug ports.

91732A097 $91.52

High-Performance Helical Inserts

Use these inserts for threads that last under difficult conditions. Also known as Heli-Coil inserts.

Coated 18-8 Stainless Steel—A fluoropolymer coating resists corrosion from contact with dissimilar metals such as aluminum and lubricates the insert to keep it from sticking during installation. Minimum tensile strength is 200,000 psi.

Titanium—These have a higher strength-to-weight ratio and are 40% lighter than stainless steel. They provide excellent resistance to salt water, chemicals, and acids. Minimum tensile strength is 150,000 psi.

Nitronic 60 Stainless Steel—Minimize sticking during installation without lubricants or coatings that can chip and contaminate particle-free environments. Minimum tensile strength is 200,000 psi.

Nickel Alloy—These inserts stand up to temperatures as high as 1,000° F and resist salt water, chemicals, and acids better than stainless steel. Minimum tensile strength is 200,000 psi.

Taps are for start-to-finish tapping of through-holes.

Also Available: Coated 18-8 stainless steel screw-lock inserts and Nitronic 60 stainless steel screw-lock inserts. Please ask for 96246A555 and specify thread size and length.

Installation Tools for Helical Inserts

Screw the insert onto the tool and drive it a quarter to half-turn below the material's surface. Compatible with Heli-Coil inserts that have a prong.

Helical Inserts without Prong

With no prong to break off and retrieve, these inserts are often used in applications where debris could cause damage. Made from 18-8 stainless steel. Minimum tensile strength is 200,000 psi. Inch sizes meet National Aerospace Standard (NAS) 1130; metric sizes meet NA0276.

Screw-lock inserts have a polygon-shaped coil that grips screws to resist loosening. *Inch sizes* meet MS-21209.

Taps are for start-to-finish tapping of through-holes.

Also Available: Lubricated inserts without prong that have a dry film to keep inserts from sticking during installation. Please ask for 91990A555 and specify thread size: 2-56, 4-40, 6-32, 8-32, 10-32, or ¼"-20 and length.

Installation and Removal Tools

Screw the insert onto the tool and drive it a quarter to half-turn below the material's surface. Tools for inch size inserts have a solid handle. Tools for metric size inserts have a hollow handle for tip storage. Replacement tips (sold separately) come with one installation or removal tip, two pins, and two springs (unless noted). **To Order:** Please specify thread size.

Installation Tool	91049A100	$302.40
Replacement Tip for Installation Tool ■	91049A200	68.06
Removal Tool for Inch Sizes	91049A600	$326.31
Removal Tool for Metric Sizes	91049A700	289.98
Replacement Tip for Removal Tools for Inch Sizes	91049A500	68.06

■ Tip for 10-32 internal thread size does not require pins and springs.

Key-Locking Inserts for Soft Metals

Drive the keys into the surrounding material for a more secure hold than thread-locking inserts. Use them to repair or convert threads in soft metals such as aluminum. They're comparable to Keensert inserts. Installation requires a drill bit, a tap, and an installation tool. Inserts with 1/4" or M6 thread size and smaller have two locking keys; 5/16" or M8 and larger have four locking keys. Thread fit is Class 2B for inch sizes and Class 6H for metric sizes.

Extra-thick-wall inserts work well in oversized and worn holes.

Thin-wall inserts have smaller external threads than thick-wall inserts, so they require a smaller drilled hole.

Mil. Spec. Key-Locking Inserts for Soft Metals

Made to stringent military specifications, these inserts are passivated for enhanced corrosion resistance. Drive the keys into the surrounding material for a more secure hold than thread-locking inserts. Use them to repair or convert threads in soft metals such as aluminum. They're comparable to Keensert inserts.

Installation requires a drill bit, a tap, and an installation tool. Made from 18-8 stainless steel; inserts may be mildly magnetic. Inserts with 1/4" thread size and smaller have two locking keys; those 5/16" and larger have four locking keys. Thread fit is Class 3B.

Crack-Repairing Inserts for Cast Metals

Also known as Lock-N-Stitch inserts, these draw surrounding material inward to repair and reinforce cracked and stripped holes. Installation requires a drill bit, a tap, and an installation tool. Made from steel. Thread fit is Class 2B (6H metric).

Insert kits include five inserts, six retaining pins, a drill bit, a tap, an installation tool, tapping fluid, and sealant.

Tapping Inserts for Soft Metals

Also known as Tap-Lok inserts, these cut their own threads so you don't have to tap the hole. Install them into a drilled hole with an installation tool (sold below) and a ratchet wrench. Installation tools can also be placed in the chuck on a drill press and turned by hand. Inserts are zinc-plated steel. Thread fit is Class 2B (Class 6H metric).

Thick-Wall Insert Assortments

Inch Coarse Thread—22 inserts. Six each 1/2″-13; seven each 5/8″-11 and 3/4″-10; two each 1″-8.

Black-Phosphate Steel — 90248A111 — $59.40

Inch Coarse Thread—46 inserts. 10 each 10-24, 1/4″-20, 5/16″-18, and 3/8″-16; and six each 1/2″-13.

18-8 Stainless Steel — 90247A031 — $192.61
Black-Phosphate Steel — 90248A112 — 52.00

Inch Fine Thread—22 inserts. Six each 1/2″-20; seven each 5/8″-18 and 3/4″-16; and two each 1″-14.

Black-Phosphate Steel — 90248A115 — $59.40

Inch Fine Thread—46 inserts. 10 each 10-32, 1/4″-28, 5/16″-24, and 3/8″-24; and six each 1/2″-20.

18-8 Stainless Steel — 90247A032 — $192.61
Black-Phosphate Steel — 90248A114 — 52.00

Metric—33 inserts. 10 each M8×1.25 and M10×1.5; eight each M12×1.75; and five each M16×2.0.

18-8 Stainless Steel — 97120A035 — $149.56
Black-Phosphate Steel — 97084A290 — 96.80

Metric—50 inserts. 10 each M3×0.5, M4×0.7, M5×0.8, M6×1.0, and M8×1.25.

18-8 Stainless Steel — 97120A034 — $149.56
Black-Phosphate Steel — 97084A280 — 69.00

Metric/Inch—36 inserts. 10 each M6×1.0, M8×1.25, and M10×1.5; and six each M12×1.75.

18-8 Stainless Steel — 97120A033 — $133.69
Black-Phosphate Steel — 97084A210 — 52.00

316 Stainless Steel Easy-to-Install Thread-Locking Inserts

These are the most corrosion resistant inserts we offer. Also known as E-Z Lok inserts, they can be installed using a slotted screwdriver. To save time in high-volume installations, use an installation bit and a drill. Loctite® adhesive on external threads keeps these inserts from loosening. The adhesive reaches full strength after 72 hours and resists pressure up to 6,000 psi. Thread fit is Class 2B. They may be mildly magnetic.

Installation requires a drill bit and a tap.

Thread Size	Tap Size	Install. Lg.	Drill Bit Size	Inserts		Installation Bits

Screw-Locking Easy-to-Install Thread-Locking Inserts

Also known as E-Z Lok inserts. Adhesive on both internal and external threads keeps inserts in place and holds screws tight. Loctite® adhesive reaches full strength after 72 hours and resists pressure up to 6,000 psi. They're black-phosphate steel for mild corrosion resistance. Thread fit is Class 2B.

Install using a slotted screwdriver or an installation bit and drill to save time in high-volume installations.

Thread-Locking Inserts for Metals

A locking element keeps these inserts from loosening. Thread fit is Class 2B. To install, thread a locknut onto a stud and use it as a tool to screw the insert into a tapped hole.

18-8 stainless steel inserts are more corrosion resistant than zinc-plated steel inserts. Inserts may be mildly magnetic.

Zinc-plated steel inserts are mildly corrosion resistant.

Insert Nuts for Socket Head Cap Screws

Also known as Allen nuts, you can use these versatile fasteners as both threaded inserts and nuts. To use as inserts, press or draw them into any nonhardened steel, cast iron, or soft nonferrous metal. You can even mold them into plastics, ceramics, fiber, and similar materials. To use as nuts, tighten them with a 6-point hex key. Thread class is 2B.

18-8 stainless steel inserts have excellent corrosion resistance and may be mildly magnetic.

Alloy steel inserts have the same strength properties as ASTM A194 Grade 2H nuts.

Press-Fit Inserts for Soft Metals

The knurled body holds these inserts in place in aluminum and other soft metals, so you don't need to tap the hole. They're tapered, so they align themselves as they're pressed into a hole. Made from zinc-plated steel. Thread fit is Class 2B. Install with an arbor press.

Tapping Inserts for Plastics

Also known as Trisert inserts, these cut threads into plastics and have excellent pull-out resistance. Flutes channel loose chips up and out to keep threads clean during installation. Made from brass, inserts are nonmagnetic, corrosion resistant, and electrically conductive. Thread fit is Class 2B. Mount in a drilled hole using an installation tool (sold separately).

Twist-Resistant Hex-Shaped Inserts for Plastics

The hex shape resists loosening and twisting. To install, drill a hole and press in place. Thread fit is Class 2B for inch sizes and 6H for metric sizes.

18-8 stainless steel inserts have better corrosion resistance than aluminum inserts and may be mildly magnetic.

Aluminum inserts are 70% lighter than stainless steel. They're mildly corrosion resistant and nonmagnetic.

Push-to-Expand Inserts for Plastics

Push down on the inside of the insert so it expands and holds firm in surrounding material before you install a screw. These are also known as Dodge inserts. Made from brass, these inserts are corrosion resistant, electrically conductive, and nonmagnetic. Installation requires an installation tool (sold separately).

			Inserts

Screw-to-Expand Inserts for Plastics

Without Flange

For Through Holes

Installing a screw causes the insert to expand and drives the knurls into the surrounding plastic. Thread fit is Class 2B for inch sizes and 6H for metric sizes.

Inserts without flange install flush or below the surface.

Inserts with flange provide a load-bearing surface for use in weak plastics. Installed length includes the flange.

Inserts for through holes install on the underside of your material. The flange keeps the insert from being pulled through a hole.

18-8 stainless steel inserts have better corrosion resistance than brass inserts and may be mildly magnetic.

Brass inserts are nonmagnetic, corrosion resistant, and electrically conductive.

Heat-Set Inserts for Plastics

Plastic softens when heated during installation, then cools to solidify around the insert's knurls and ridges to resist torque and pull-out. These are also known as Ultrasert inserts. Create a hole with a drill bit and taper the hole to the larger hole diameter using a reamer, then install the insert using a soldering iron with an installation tip (sold separately). Inserts are made from brass, which is nonmagnetic, corrosion resistant, and electrically conductive. Thread fit is Class 2B for inch sizes and 6H for metric sizes.

Barbed Inserts for Softwood

Barbs provide holding power in softwood. To install, hammer into a drilled hole. Made from zinc alloy, these inserts are mildly corrosion resistant. Thread class is 2B.

Flush-mount inserts are installed flush or below the surface material.

Open-end inserts allow long screws and bolts to pass through the insert. Length is measured from under the flange. Flange thickness is 0.059″-0.098″.

Tapping Inserts for Wood

Inserts for Hardwood with Slotted Drive

Inserts for Softwood with Hex Drive

Inserts for Hardwood with Hex Drive

Flanged Inserts for Softwood with Hex Drive

Inserts cut their own threads and stay secure once installed. They have a smaller profile and fit in tighter spaces than tee nut inserts. Install with a screwdriver or, for faster installation, use an installation bit that fits onto a power drill (sold separately). Thread class is 2B for inch sizes and 6H for metric sizes.

Inserts for Hardwood—Also known as knife thread inserts, these have sharp threads that cut into hardwood for a secure hold. *Brass* inserts are nonmagnetic, mildly corrosion resistant, and electrically conductive. *18-8 stainless steel* inserts have excellent resistance to chemicals and may be mildly magnetic. *Steel* inserts are made from high-strength steel and are for use in hard materials.

Inserts for Softwood—Large threads cut into softwood such as particleboard for a strong hold. Made from zinc alloy, these inserts are mildly corrosion resistant. *Flanged* inserts are resistant to being pulled through a hole. Flange thickness is 0.025″-0.04″ for inch sizes and 0.635-1.016 mm for metric sizes. Length is measured from under the flange.

Surface-Mount Inserts for Wood

These screw-mount inserts are often used to attach glides and levels to wood and particleboard. The ribbed barrel adds holding strength. Made from rust-resistant zinc alloy. Thread class is 2B. Flange thickness is 0.098″. Length does not include the flange.

Internal Thread	Insert Lg.	Max. Flange Dia.	Drill Size	Pkg. Qty.		Pkg.

Snap-In Inserts for Thin Materials

Square Flange

Round Flange

Add threads in thin panels from 1/32″ to 5/32″ thick. To install, snap the prongs into a square hole. The screw pushes the prongs tight against the panel. Made from nylon that withstands temperatures up to 167°F. Color is off-white. Length is measured from under the flange.

Secure-Grip Tee Nut Inserts for Wood

Hooked prongs give these tee nut inserts excellent holding power in softwood such as particleboard and prevent push out when removing screws. To install, hammer into a drilled hole. Length is measured from under the flange. They're zinc-plated steel for mild corrosion resistance. Thread class is 2B.

Screw-Locking Tee Nut Inserts for Wood

Use where vibration is a concern—these tee nut inserts have distorted threads that lock screws in place and four prongs on the flange to resist twisting in hardwood and softwood. To install, hammer into a drilled hole. Length is measured from under the flange. Inserts are zinc-plated steel for mild corrosion resistance. Thread class is 2B.

Thread Size	Lg.	Flange Dia.	Drill Bit Size	Pkg. Qty.		Pkg.

Tee Nut Inserts for Wood

Put durable steel threads in wood and particleboard. To install, hammer into a drilled hole. To minimize splitting in hardwood, choose nuts with fewer prongs. Length is measured from under the flange. Thread class is 2B for inch sizes and 6H for metric sizes.

Zinc-plated steel inserts have mild corrosion resistance.

18-8 stainless steel inserts have better corrosion resistance than zinc-plated steel inserts.

316 stainless steel inserts are the most corrosion resistant inserts we offer, and stand up to chemicals and salt water.

Ultra-Split-Resistant Tee Nut Inserts for Hardwood

Ridges on the barrel of these tee nut inserts make them good for use in end-grain applications where the prongs on standard tee nut inserts might cause the wood to split. To install, hammer into a drilled hole. Length is measured from under the flange. Inserts are steel, unless noted. Thread class is 2B.

■ Zinc-plated steel.

Rivet-Type Studs

Provide a protruding stud for threading components together during assembly. An alternative to weld and press-in studs, they have a knurled body that resists torque and vibration. Install them in a drilled hole with a tool (required, see 92388A120 on page 3335).

Made from rust-resistant zinc-plated steel. Body length is measured from under the flange. Stud length is based on maximum material thickness. Thread class is 2A. Use with Grade 5 nuts.

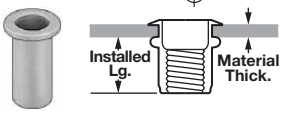
Rivet Nuts



These nuts collapse and flare during installation to create a backside flange that grips the material and holds them in place. Also known as blind inserts, they can be installed when you have access to only one side of the material. Install in a drilled hole using a rivet nut tool. Length is measured from under the flange. Thread class is 2B, except thread sizes 8-32, 10-32, and 1/4″-20 are thread class 3B.

Aluminum nuts are one-third the weight of steel and have mild corrosion resistance.

Zinc-plated steel nuts are about twice as strong as aluminum, and have mild corrosion resistance.

Kits

103-Piece—Includes four nosepieces, four mandrels, a plier-style installation tool, and the following nuts: 25 aluminum 6-32 nuts, 25 steel 8-32 nuts, 25 steel 10-24 nuts, 20 aluminum 1/4″-20 nuts, and 8 steel 1/4″-20 nuts. Overall material thickness range is 0.010″ to 0.165″.

95585A300 ..... $94.22

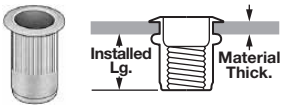
200-Piece—Kits include two nosepieces with mandrels, a plier-style installation tool, and 200 nuts.

Inch kit includes 80 size 8-32 nuts and 120 size 10-32 nuts. Overall material thickness range is 0.010″ to 0.180″.

Metric kits include 120 size M4 nuts and 80 size M5 nuts. Overall material thickness range is 0.25 mm to 5 mm.

Inch Kit—Aluminum	92387A690	$179.82
Metric Kit—Aluminum	92387A810	181.65
Metric Kit—Zinc-Plated Steel	92387A850	194.02

Twist-Resistant Rivet Nuts



A ribbed body holds the nut in place so it won't move when tightening a screw. Install in a drilled hole using a rivet nut tool. The tool collapses the nut, creating a backside flange that holds the nut to the material. Length is measured from under the flange. Thread class is 2B for inch sizes and 6H for metric sizes.

Aluminum nuts are one-third the weight of steel and mildly corrosion resistant.

Zinc yellow-chromate plated steel nuts are about twice as strong as aluminum. They have good corrosion resistance.

18-8 stainless steel nuts are the most corrosion resistant and stand up to chemicals.

Open End—Nuts are open at the bottom, so you can use a long screw or bolt.

Closed End—The thread area is enclosed, which prevents leakage past the threads from either side.

Flange-Sealing—Have a PVC foam seal under the flange to keep liquids and gases from leaking between the nut and surrounding material.

50-Piece Open-End Rivet Nut Kits—Zinc Yellow-Chromate Plated Steel

Inch—Includes three nosepieces, four mandrels, a plier-style installation tool, and the following nuts: 12 each size 8-32, 10-24, and 10-32; 14 size 1/4"-20. Overall material thickness range is 0.020" to 0.260".

95105A400 ..... $95.70

Metric—Includes three nosepieces, three mandrels, a plier-style installation tool, and the following nuts: 12 size M4×0.7, 24 size M5×0.8, and 14 size M6×1. Overall material thickness range is 0.5 mm to 6.6 mm.

95105A500 ..... $99.80

Heavy Duty Twist-Resistant Rivet Nuts

A hex-shaped body provides the highest twist resistance of any rivet nut. Install in a drilled hole with a lever-style or power-driven rivet nut tool. The tool collapses the nut, creating a backside flange that holds the nut to the material. Length is measured from under the flange. They're zinc-plated steel for mild corrosion resistance. Thread class is 2B.

Twist-Resistant Rivet Nuts for Soft Materials

Wedges under the flange lock the nut in place in soft materials such as brass and aluminum, so it won't turn when tightening a screw. Install in a drilled hole with a hydraulic/air-powered rivet nut tool. The tool collapses the nut, creating a backside flange that holds the nut to the material. Length is measured from under the flange. Made from aluminum, they're one-third the weight of steel and mildly corrosion resistant. Thread class is 2B.

Low-Profile Rivet Nuts

Use these rivet nuts for light duty fastening in low-clearance applications.

Cadmium-plated rivet nuts have good corrosion resistance and lubricity so they collapse smoothly. **Tin-plated 18-8 stainless steel** rivet nuts have excellent resistance to chemicals.

Rivet nut kits include rivet nuts, mandrels, and an installation tool. Kits in sizes 8-32, 10-32, and 1/4"-20 have 100 nuts; all others have 50. **Rivet nut tool assortments with installation tool** contain cadmium-plated steel rivet nuts, a rivet nut tool, and mandrels.

Rivet nut tool and **mandrel** (both sold separately) are required for installation. To use, thread the nut onto a mandrel of the same size, then place it into a hole, push down on the tool's T-handle, and turn clockwise. Turn counterclockwise to remove the tool and mandrel.

Rivet Nut Assortments with Installation Tool

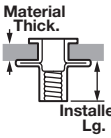
275-Piece Inch Kit—Contains 50 each of sizes 4-40, 6-32, 8-32, 10-32, and 1/4"-20; 25 each of size 5/16"-18, and six mandrels.

98560A131 ..... $239.98

225-Piece Metric Kit—Contains 50 each of sizes M3×0.5, M4×0.7, M5×0.8, and M6×1.0; 25 each of size M8×1.25; and five mandrels.

91230A600 ..... $222.28

Rivet Nuts for Plastic and Composites



Once installed these rivet nuts have a large back flange that distributes the load across a broad area for a strong hold in plastic and composites. Install them in a drilled hole with a wrench- or power-driven rivet nut tool. Rivet nuts are zinc yellow-chromate plated steel. Thread class is 2B.

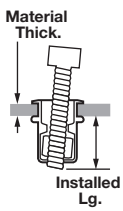
Aligning Rivet Nuts



Threads move so your screw can enter at a slight angle to align with an off-center part. Install in a drilled hole with a wrench-driven tool (sold separately below). Known as Riv-Float nuts, they're zinc-plated steel. Thread class is 2B.

To Order: Tool for 0.371" and 9.4 mm length nuts, please specify thread size for rivet nut: 8-32, 10-24, 10-32, M4, or M5.

96349A555 ..... $29.84

To Order: Tool for 0.690", 0.784", 17.5 mm and 19.9 mm length nuts, please specify thread size for rivet nut: 8-32, 10-32, 1/4"-20, M4, M5, or M6.

96349A777 ..... $33.00

Screw-to-Install Rivet Nuts

Your fastener sets the insert as you screw it into thin and brittle materials. Length is measured from under the flange. For quicker installation of steel nuts, use the *optional rivet nut tool* (pull rod required; sold separately). 90186A211 and 90186A213 include a *friction-wrench tool* to hold the flange in place when installing with a screwdriver.

Zinc-plated steel nuts are mildly corrosion resistant. They're also known as jack nuts.

PVC-coated steel nuts minimize scratches to the surface of your material and are more corrosion resistant than zinc-plated steel rivet nuts.

Sealing steel nuts have an acrylic-coated flange to seal out moisture and resist corrosion.

Rubber-insulated brass nuts have a nonconductive rubber coating that insulates the nut from electricity, seals out moisture, and damps vibration. Also known as well nuts.

Rivet Nut Tools

Plier Style

Install rivet nuts with one hand. Sets all styles of aluminum rivet nuts up to 3/8" or M8 and steel rivet nuts up to 1/4" or M6. Includes mandrels and nosepieces to set 8-32, 10-24, and 10-32 sizes (additional sizes sold separately). Weighs 1 lb.

Tool ..... 95585A600 ..... $56.28

Additional Mandrel and Nosepiece Sets—To Order: Please specify thread size: 6-32, 8-32, 10-24, 10-32, 1/4"-20, 5/16"-18, 3/8"-16, M4, M5, M6, M8. Sets for thread sizes 5/16-18, 3/8"-16, and M8 include mandrel only (no nosepiece needed).

Sets ..... 95585A777 ..... $14.58

Lever Style

Squeeze the handles together with two hands to maximize leverage when installing aluminum and steel smooth rivet nuts up to 3/8". Tool includes one 1/4"-20 mandrel and nosepiece set (additional sizes sold separately). Weighs 4 lbs.

Tool ..... 95603A770 ..... $157.29

Additional Mandrel and Nosepiece Sets—To Order: Please specify thread size: 10-24, 10-32, 1/4"-20, 5/16"-18, 3/8"-16, M5, M6, M8, or M10.

Sets ..... 95603A555 ..... $15.56

Lever Style with Visual Stroke Indicator

Tool with Knob

Mandrel and nosepiece sets (required) are sold separately.

Tool with knob installs rivet-type studs and smooth and ribbed body rivet nuts. It has a spin-to-reverse knob to quickly unthread the mandrel from the installed nut. It sets smooth rivet nuts up to 1/4"-20 and M6, and ribbed rivet nuts and rivet studs up to 3/8"-16 and M10. Weighs 4.5 lbs.

Tool with plunger installs smooth and ribbed body rivet nuts. It has a quick-acting, pull-to-remove plunger that unthreads the mandrel from the installed nut. It sets smooth rivet nuts up to 5/16"-18 and M8, and ribbed rivet nuts up to 1/2"-20 and M10. Weighs 5 lbs. It does not set rivet studs.

Tool with Knob ..... 92388A120 ..... $275.53
Tool with Plunger ..... 92388A125 ..... 495.97

Mandrel and Nosepiece Sets—To Order: Please specify thread size: 6-32, 8-32, 10-24, 10-32, 1/4"-20, 1/4"-28, 5/16"-18, 3/8"-16, 1/2"-13, 1/2"-20, M4, M5, M6, M8, or M10.

For Smooth Rivet Nuts ..... 92388A533 ..... $40.88
For Ribbed Rivet Nuts ..... 92388A122 ..... 40.88
For Stud Rivet Nuts ..... 92388A755 ..... 40.88

Wrench-Driven Rivet Nut Tools

Install all styles of rivet nuts. A wrench and ratchet are required. Use a 7/8" wrench (not included) to hold the tool and an 11/16" ratchet (not included) to tighten the nut.

To Order: Please specify thread size: 6-32, 8-32, 10-24, 10-32, 1/4"-20, 1/4"-28, 5/16"-18, 5/16"-24, 3/8"-16, 3/8"-24, M3, M4, M5, M6, M8, or M10.

96349A555 ..... $29.84

Power-Driven Rivet Nut Tools

Install rivet nuts more quickly and easily than with manual tools. To use, thread a rivet nut onto the mandrel and press the trigger to spin the nut onto the tool. Place the nut into the material and press the trigger to install the nut. Press the trigger one more time to spin the mandrel off.

Cordless Rechargeable

The battery pack fully charges in one hour and installs up to 600 rivet nuts per charge. Tool provides 2,800 lbs. of pulling power with an adjustable stroke up to 0.22" and includes mandrels and nosepieces to install 8-32, 10-32, and 1/4"-20 rivet nuts (additional sizes sold separately); a 14.4 volt battery pack, and a charger. Weighs 5 lbs. Tool and battery charger cannot be sold in California or Oregon.

To Order: For additional mandrels and nosepieces, please specify thread size: 6-32, 8-32, 10-32, 1/4"-20, 5/16"-18, 3/8"-16, M4, M5, M6, M8, or M10. Note: The 3/8"-16 mandrel and nosepiece only set aluminum rivet nuts.

Tool ..... 90336A110 ..... $1,592.41
Replacement Battery Pack ..... 90336A730 ..... 306.98
Replacement Battery Charger ..... 90336A720 ..... 253.66
Additional Mandrels ..... 90336A222 ..... 24.69
Additional Nosepieces ..... 90336A333 ..... 25.69

Hydraulic/Air Powered

Quickly install all styles of rivet nuts at 1.5-second intervals. Tool provides 3,960 lbs. of pulling power with an adjustable stroke up to 0.28". Operating pressure is 75-100 psi. Connection is 1/4 NPT. Weighs 3.5 lbs.

Nosepiece assemblies (are required and sold separately). **To Order:** Please specify thread size: 8-32, 10-24, 10-32, 1/4"-20, 5/16"-18, 3/8"-16, M4, M5, M6, M8, or M10.

Tool ..... 92894A700 ..... $1,668.86
Nosepiece Assemblies ..... 92894A444 ..... 96.55

Air Powered

Smaller and lighter than cordless and hydraulic rivet nut tools, use these to install smooth rivet nuts. Operating pressure is 35-45 psi for sizes 4-40 and M4; 70-80 psi for sizes 6-32 to 1/4"-28, M5 and M6; and 90-110 psi for sizes 5/16"-18 to 1/2"-20, and M8 to M12. Connection is 1/4 NPT. Weighs 4 lbs.

To Order: Please specify thread size: 4-40, 6-32, 8-32, 10-24, 10-32, 1/4"-20, 1/4"-28, 5/16"-18, 5/16"-24, 3/8"-16, 3/8"-24, 1/2"-13, 1/2"-20, M4, M5, M6, M8, M10, or M12.

Tool ..... 94675A111 ..... $648.90

Also Available: Nosepiece assemblies that include a hex drive, mandrel, bearing set, and nose cone. Please ask for 94675A660 and specify thread size.

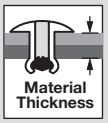
Also Available: Replacement mandrels. Please ask for 94675A550 and specify thread size.

About Blind Rivets

Blind rivets join materials together when you don't have access to both sides. They consist of a *rivet* (a hollow body with a head) and a *mandrel* (a thin nail with a bulbed end). Rivets require a setting tool for installation (see pages 3341-3343).

To hold rivets in large holes and soft materials use Blind Rivet Washers (see 90183A on page 3271).

To select the proper rivet there are several factors to consider:

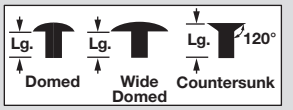


Material Thickness— Make sure the combined thickness of the materials you are joining falls within the rivet's material thickness range.

Diameter— The diameter of the rivet body determines the hole size.

Material— To maximize strength and minimize corrosion, use rivets made of the same material as the components you are fastening. When an exact match isn't possible, choose rivets that are painted or coated.

Shear and Tensile Strengths— To ensure rivets have the strength you need, consider *shear strength* (the amount of force it takes to break a rivet from the side) and *tensile strength* (the amount of pull a rivet can withstand without breaking). *Note:* Joint strength is also affected by the space between the rivets, their distance from the edge of the work, and hole size.

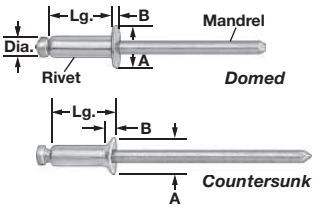


Head Style— *Domed* rivets are suitable for most applications. They have a low profile and a neat appearance. *Wide-domed* rivets have a large head diameter that provides extra holding strength for soft, thin materials or oversized holes. *Countersunk* rivets have an angled head that sits flush when installed.

How to Install a Blind Rivet

Insert the rivet through a hole that passes through the materials being joined. Using a rivet tool with the same size nosepiece as the rivet diameter, grip the mandrel and pull the trigger or lever. The tool pulls the mandrel through the rivet, deforming the rivet's body and breaking off the excess mandrel.

Blind Rivets



Also known as Pop and open-end rivets, these blind rivets meet IFI 114 (Industrial Fasteners Institute) standards, unless noted.

18-8 stainless steel rivets and mandrels have excellent corrosion resistance and may be mildly magnetic.

Aluminum rivets and mandrels are corrosion resistant and nonmagnetic.

Zinc-plated steel rivets with steel mandrels have good rust resistance.

Aluminum rivets with steel mandrels meet MIL-R-24243/1E wherever a dash number is shown. They are corrosion resistant and nonmagnetic.

Corrosion-Resistant Blind Rivets

Rivets are ideal for marine and other outdoor applications.

Type 316 stainless steel rivets and mandrels have better corrosion resistance than 18-8 stainless steel. May be mildly magnetic.

Copper and ***nickel-copper*** rivets are corrosion resistant and nonmagnetic. They have steel mandrels. Rivets meet IFI 114 (Industrial Fasteners Institute) standards.

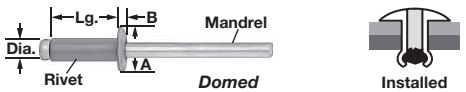
Choose-a-Color Blind Rivets



Select a color that makes your rivets stand out or blend in. Rivets and mandrels are aluminum, which is corrosion resistant and nonmagnetic. They meet IFI 114 (Industrial Fasteners Institute) standards.

To Order: Please specify color: black, blue, dark brown, gray, red, white, or yellow.

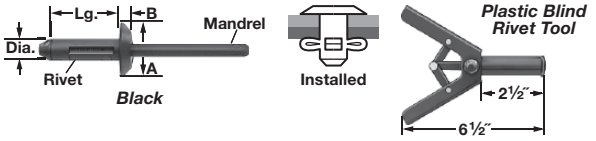
Plastic Blind Rivets and Tools



Fasten plastics to wood, metal, fiberglass, acrylics, and other synthetics. All rivets are nylon; choose from off-white rivets with nylon mandrels and black rivets with acetal mandrels. Acetal is more moisture resistant than nylon. Nylon absorbs moisture which can affect dimensions and other properties. Rivets are electrically non-conductive. Temperature range is –22° to +176° F. Head is domed.

Install with the *plastic blind rivet tool* sold separately below.

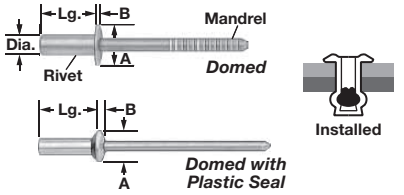
Plastic Blind Rivet Tool

Installs all sizes of plastic blind rivets. It takes one hand to operate and installs most rivets with a single stroke. Closed height is 1¾″.

90540A210 ..... $54.44

Sealing Blind Rivets



Also known as closed-end sealing rivets, they prevent water and air from passing through or around them. Because most of the mandrel is retained, they have higher shear and tensile strengths than standard blind rivets of the same size and material.

Stainless steel rivets and mandrels have excellent corrosion resistance and may be mildly magnetic. Rivets are 18-8 stainless steel; mandrels are 300 series stainless steel. ***Aluminum*** rivets and mandrels are corrosion resistant and nonmagnetic. ***Aluminum with steel mandrel*** rivets have corrosion resistant and nonmagnetic bodies.

Domed with plastic seal rivets have a sealant bonded underneath the head to reduce leaks. The sealant withstands temperatures of –60° to 250° F. Rivets and mandrels are aluminum, which is corrosion resistant and nonmagnetic.

High-Strength Blind Rivets

Also known as structural rivets, they have higher shear and tensile strengths than standard blind rivets of the same size and material.

***Domed*—**Also known as Q-rivets, they're resistant to vibration.

***Domed for Wide Thickness Ranges*—**Also known as ultra-grip rivets, they can handle a wide range of thicknesses.

18-8 stainless steel rivets and mandrels have excellent corrosion resistance and may be mildly magnetic. ***Zinc-plated steel*** rivets and mandrels have good corrosion resistance. ***Aluminum*** rivets and mandrels are corrosion resistant and nonmagnetic.

Blind Rivets for Soft and Brittle Materials

When installed, rivet bodies fan out to provide a uniform grip. They're good for oversized holes. Heads are domed.

***Peel Style*—**Fasten soft materials such as plastic and fiberglass to thin materials such as sheet metal. When installed, the body splits into "petals" that draw materials together without pulling through them. Rivets are aluminum, which is corrosion resistant and nonmagnetic. Mandrels are steel.

***Bulb Style*—**Part of the mandrel is retained, which increases shear strength. They're designed to fasten brittle materials such as plastic and laminates without damaging them. Rivets and mandrels are aluminum, which is corrosion resistant and nonmagnetic.

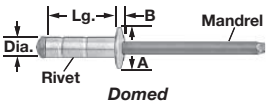
Wide Thickness Range Blind Rivets



Domed

Installed

Also called multigrip rivets, the rivet body expands to fill slightly oversized and irregular holes. Each size has up to twice the material thickness range of standard blind rivets. When installed, the mandrel remains in the body which reduces vibration and forms a moisture-resistant seal. Rivets are aluminum, which is corrosion resistant and nonmagnetic. Mandrels are steel.

To Order: For painted rivets, please specify color: black or white.

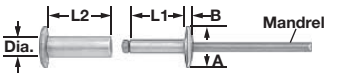
Tamper-Resistant Two-Piece Rivets



Installed

A solid, smooth head makes these rivets difficult to pry or remove. They accommodate extra-wide thicknesses and have a large diameter head on each side to grip soft materials tightly without crushing them. Rivets are aluminum, which is corrosion resistant and nonmagnetic. Mandrels are steel. Not rated for shear strength.

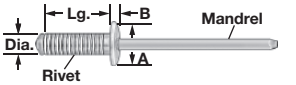
Grooved Blind Rivets for Wood



Installed

As it's installed, the rivet body expands and the grooves dig into the wood for a tight hold. Rivets are aluminum, which is corrosion resistant and nonmagnetic. They have steel mandrels. Head is domed. Not rated for shear and tensile strengths.

Blind Rivet Assortment

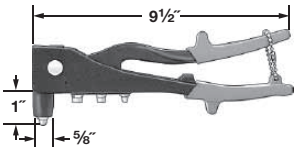
Includes 585 domed aluminum rivets, which are corrosion resistant and nonmagnetic. Mandrels are steel. Contains 1/8″ and 3/16″ diameter rivets in the following thickness ranges: 0.063″-0.125″, 0.126″-0.187″, 0.126″-0.25″, 0.188″-0.25″, 0.251″-0.375″, and 0.376″-0.5″. Packaged in a compartmented plastic box with lid chart.

97455A300 ..... $60.86

Manual Tools for 3/32"-3/16" Diameter Blind Rivets

All tools come with four nosepieces, unless noted. Tools install 3/32", 1/8", 5/32", and 3/16" dia. standard blind rivets that are all aluminum, aluminum with steel mandrels, and all steel. They also install 3/32", 1/8", and 5/32" dia. standard blind rivets in 18-8 stainless steel and Type 316 stainless steel, as well as 1/8" dia. copper rivets with steel mandrels. They do not install nickel-copper blind rivets.

Heavy Duty Tool



Our most popular manual blind rivet tool.

The *rivet tool kit* includes the tool plus 175 domed rivets (100 1/8" dia. all-steel, 50 1/8" dia. all-aluminum, and 25 3/16" dia. aluminum with steel mandrel) and 25 countersunk rivets (1/8" dia. all-steel). Includes 0.063"-0.125" and 0.188"-0.25" material thickness ranges.

Ratchet-Action Tool with Mandrel Collector

Easiest to use; lets you install rivets with up to 40% less force. It has a mandrel collector that catches spent mandrels and stores nosepieces.

The tool comes with three nosepieces to install 1/8", 5/32", and 3/16" dia. blind rivets. To install 3/32" dia. blind rivets, order the optional 3/32" nosepiece (sold separately).

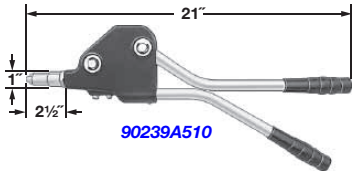
Manual Lever-Handle Tools for 1/8"-1/4" Diameter Blind Rivets



Long handles give you extra leverage to install rivets in areas where other tools can't reach. For an additional 2½" of reach, add the optional nose extension (sold separately).

Tool comes with three nosepieces to install 5/32", 3/16", and 1/4" dia. blind rivets in all materials. To install 1/8" dia. blind rivets, order the optional 1/8" nosepiece (sold separately).

The *rivet tool with mandrel collector* includes a built-in mandrel receptacle.

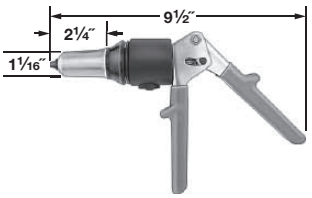
Hydraulic Powered Tools for 3/32"-1/4" Diameter Blind Rivets and Rivet Nuts



This self-contained hydraulic tool lets you install blind rivets and knurled and standard rivet nuts with one hand. (See pages 3332-3333 for rivet nuts.)

Tool comes with five nosepieces to install 3/32", 1/8", 5/32", 3/16", and 1/4" dia. blind rivets, plus pull-up studs and anvils to install 10-24 and 1/4"-20 aluminum and steel rivet nuts. Furnished in a plastic case.

Also Available: Pull-up studs and driving anvils for 6-32 to 3/8"-16 and M3 to M10 rivet nuts. Please ask for 6879A555 and specify size.

(A) Mandrel Collecting Tool— Comes with three nosepieces and a plastic mandrel collection bottle. A vacuum system holds rivets in place during installation. Maximum air pressure is 100 psi. Air hose is 6 ft. long. Hose fitting is 3/8″ NPT female. Overall size is 9″ Ht.×11″ Wd.

(B) Standard Tool and ***(C) Long Reach Tool—*** Come with three nosepieces. A *3/32″ nosepiece* (sold separately) lets you install 3/32″ dia. rivets in all materials. Maximum air pressure is 85 psi. Air hose is 6 ft. long. Hose fitting is 3/8″ NPT female. *Style B* includes an extra pair of jaws, a jaw pusher, and a jaw pusher spring. Overall size is 9 1/2″ Ht.×9 1/2″ Wd. *Style C* has an extra-long nosepiece for hard-to-reach applications. Overall size is 9 1/2″ Ht.×11 1/2″ Wd.

(D) Heavy Duty Tool— Comes with three nosepieces and a plastic mandrel collection bottle. Maximum air pressure is 90 psi. Air hose is 4 ft. long. Hose fitting is 3/8″ NPT female. Overall size is 10 3/16″ Ht.×12″ Wd.

(E) Super Heavy Duty Tool— Comes with four nosepieces and a plastic mandrel collection bottle. Maximum air pressure is 90 psi. Air hose is 6 ft. long. Hose fitting is 3/8″ NPT female. Overall size is 12 1/2″ Ht.×13″ Wd. Use the *3/16″* and *1/4″ nosepieces* (sold separately) to set T-rivets and Monobolt rivets (except for stainless steel T-rivets).

(F) Vertical Tool— Can be suspended over a workbench. Comes with four nosepieces. A vacuum system holds rivets in place during installation. Maximum air pressure is 85 psi. Hose fitting is 1/4″ NPT male (air hose not included). Overall size is 16″ Ht.×3″ Wd.

(G) Low Clearance Tool— Comes with four nosepieces and an adjustable mandrel deflector. Maximum air pressure is 85 psi. Hose fitting is 1/4″ NPT male (air hose not included). Overall size is 8″ Ht.×11 1/2″ Wd.

(H) Economy Tool— Comes with four nosepieces and a plastic mandrel collection bottle. Maximum air pressure is 90 psi. Hose fitting is 1/4″ NPT female (air hose not included). Overall size is 11″ Ht.×9″ Wd.

Tools

All tools come with nosepieces to install blind rivets up to the body diameters listed below.

Drill Attachments for 1/8"-1/4" Diameter Blind Rivets

Insert the hex shaft of these attachments into a 3/8" diameter or larger drill chuck and tighten to convert a cordless, electric, or air-powered drill into a blind rivet tool. Operate in forward to set rivets and in reverse to eject mandrels.

Cordless Tools for 3/32"-3/16" Diameter Blind Rivets

Perfect when there's no power source nearby. Comes with four nosepieces to install 3/32", 1/8", 5/32", and 3/16" blind rivets. A 14-volt battery and battery charger are included. Installs up to 800 rivets with a full charge. Pull capacity is 1,900 lbs.; stroke length is 7/8". Nose is 3/4" Dia.×2 3/16" Lg. Overall size is 10 1/4" Ht.×10 1/4" Wd. Comes in a plastic case.

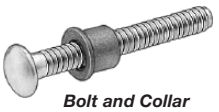
High-Strength Bolt-Type Rivets and Air-Powered Installation Tools

Rivets



Bolt and Collar

Collar

Choose these rivets when you need a strong permanent joint that delivers high uniform clamp force and vibration resistance. Also called Magna-Grip lockbolts, they are made of zinc-plated steel. Length is measured from under the head.

A complete rivet consists of a ribbed (not threaded) bolt and a collar (each sold separately). A tool and a nosepiece (sold separately below) are required for installation.

Tool

Required to install the bolt-type rivets above, this tool shapes the collar to the workpiece to lock the joint in place. It is hydraulic and air powered. A nosepiece (sold separately below) is required. Pull capacity is 5,200 lbs.; stroke length is 5/8". Maximum air pressure is 100 psi. Air hose fitting is 1/4" NPT female (air hose not included). Overall size is 12 1/2" Ht.×8 1/2" Wd.

Mil. Spec. Solid Rivets

Made of heat-treated aluminum with a matte gold finish per MIL-C-5541.

Low-profile domed rivets meet MS 20470 and NASM 20470. Head height is approximately 65% of other domed head rivets. Length is measured from under the head.

Countersunk rivets meet MS 20426 and NASM 20426. Head is countersunk 100°. Length is measured from the top of the head.

Domed and Flat Head Solid Rivets

Length is measured from under the head. ***18-8 stainless steel*** rivets have excellent corrosion resistance; may be mildly magnetic. ***Aluminum*** rivets are nonmagnetic and have mild corrosion resistance. ***Brass*** rivets are nonmagnetic with good strength, durability, corrosion resistance, and electrical conductivity. ***Copper*** rivets are electrically conductive and corrosion resistant.

Low-Profile Domed Head Solid Rivets

A lower head height than other solid rivets provides a more finished appearance when installed. Length is measured from under the head.

Domed—*Steel* rivets are also known as truss head rivets. *Aluminum* rivets are also known as universal head rivets. They are nonmagnetic and have mild corrosion resistance.

Wide Domed—Also known as brazier head rivets. All are aluminum and are nonmagnetic and have mild corrosion resistance.

Countersunk Head Solid Rivets

Head is flush when installed. Length is measured from the top of the head.

18-8 stainless steel rivets have a 90° countersunk head. They have excellent corrosion resistance and may be mildly magnetic.

Steel rivets have a 90° countersunk head.

Aluminum rivets have a 78° countersunk head. They offer mild corrosion resistance and are nonmagnetic.

Brass rivets have a 90° countersunk head. They are nonmagnetic with good strength, durability, corrosion resistance, and electrical conductivity.

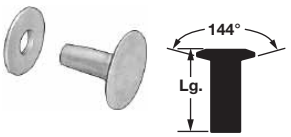
Wide-Countersunk Head Solid Rivets with Bearing Washer



Heads are countersunk 144° to provide a flush surface when set—just what you need for fastening leather, conveyor belts, and copper-alloy assemblies. Also known as belt rivets. All have a tapered shank and are made of corrosion-resistant copper. An equal quantity of washers is included with the rivets. Length is measured from the top of the head.

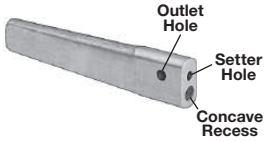
Installation Tools for Solid Rivets



Set solid rivets using this tool and your hammer. For proper installation, choose a tool with a setter hole diameter slightly larger than the rivet being set. Use the setter hole and concave recess to draw sheet metal around the rivet, flatten the shank, and form a domed head. Use the outlet hole on the side of the tools to dislodge metal slugs. Made of steel.

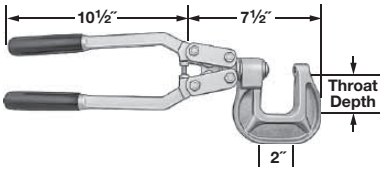
Squeeze Tools for Aluminum and Brass Solid Rivets



You'll get 3,500 pounds of pressure to set aluminum or brass solid rivets. Tool head rotates 360°. Maximum rivet length is 5/8″.

Note: Not for use with steel or stainless steel rivets.

Die sets are sold separately and include check nuts.

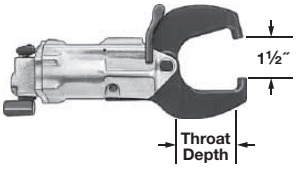
Air-Powered Squeeze Tools for Aluminum and Steel Solid Rivets



Tools

Also known as alligator squeezers, these tools offer uniform results and quiet operation when setting solid metal rivets. Tools have a throttle to control speed. They have a 1/4″ NPT female swivel air inlet. Maximum air pressure is 90 psi.

Rivets for Soft Materials

Join lightweight materials such as leather, canvas, plastics, wood, fiberboard, and light gauge metals.

Split rivets are also known as truss-head rivets. To install, punch a hole, drive in with a hammer, and split legs. *Nickel-plated steel* rivets have fair rust and weather resistance. *Brass* rivets are corrosion resistant and nonmagnetic.

Semi tubular rivets are also known as brake-lining rivets. Head is countersunk 150°. All are made of brass so they are corrosion resistant. They are also non-magnetic. Internal hole depth is 1/8" to 1/4". A punched hole is required. Use an installation tool (sold separately on this page) for proper installation.

Full tubular rivets are self piercing and have an internal hole that extends nearly the full length of the shaft, which eliminates the need for a punched hole. Internal hole depth is 1/4" to 1/2". Head is countersunk 150°. All are made of copper-plated steel that has fair rust and weather resistance. Use the installation tool (sold separately on this page) for proper installation.

Installation Tools for Tubular Rivets

One of these tools and your hammer are all you need to clinch or expand the base of semi tubular and full tubular rivets. Tools are made of steel. Use on aluminum, steel, brass, and copper rivets.

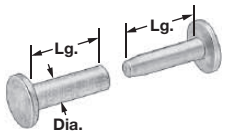
Two-Piece Press-Fit Tubular Rivets



Also known as cutlery rivets. Press the solid male shank into the tubular female piece to fasten wood to metal and metal to metal. Rivets are made of brass.

Vibration-Resistant Panel Screws

Also known as Fab-Lok fasteners, these combination rivet/screws have enough holding power to withstand excessive vibration, expansion, and contraction. After tightening, the sleeve stays in place even if the screw is removed. Use for fastening metal and insulated panels.

Each panel screw consists of a 10-24 machine screw with a hex-washer head, a 1/2" dia. EPDM sealing washer, and an aluminum sleeve that fans out when installed for added strength. A corrosion-resistant coating provides 100 hours of salt-spray resistance and acts as a lubricant to reduce friction.

Like blind rivets, they install from one side only. Set them in a 5/16" dia. hole using a 5/16" closed-end wrench. For faster installation, use a torque adjustable power driver along with the *holding tool and socket* (sold separately).

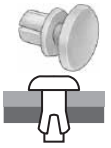
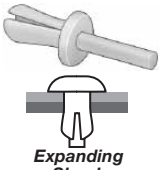
Easy-to-Install Plastic Rivets

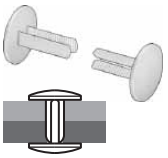
Ribbed Shank



Click-Lock Shank



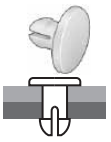
Expanding Shank



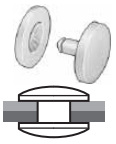
Interlocking Shank

Adjustable Shank

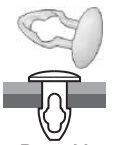
Reusable Arrow Shank



Split Shank



Snap Shank



Reusable Keyhole Shank

No special tools required when you use these rivets to join plastic, composite, metal, wood, foam, and particleboard panels. Also known as push, panel, and tree clips, each rivet fastens a specific material thickness or thickness range. All are made of nylon. Temperature range is –40° to +149° F. *Note:* Nylon absorbs environmental moisture, which can affect dimensions and other properties.

To Order: Please specify color: black or off-white (unless noted).

***Ribbed Shank*—** Shank grips and holds materials for a secure, permanent joint. A removal tool is sold separately below.

***Click-Lock Shank*—** Place in a hole and press the head. When you hear a snap, you know the shaft has expanded and the rivet is secured. Pry to remove.

***Expanding Shank*—** Insert the rivet in a hole and press the pin. This expands the shaft and locks the rivet in place.

***Interlocking Shank*—** Identical parts with internally serrated prongs ratchet together. Two heads provide a finished look on both sides.

***Adjustable Shank*—** Consist of a rivet and a washer. Insert the rivet in the hole and push the washer to the desired length. Clip excess length if needed. Pry apart or cut to remove.

***Reusable Arrow Shank*—** Arrow shape collapses when pushed through a hole then springs back completely to hold fast. Pry to remove.

***Split Shank*—** A rounded, split shank (unless noted) compresses to slide through a hole, then expands to form a strong joint.

***Snap Shank*—** Push the male and female parts together. Two heads provide a finished look on both sides. Pull apart to remove.

***Reusable Keyhole Shank*—** The extra-flexible body slips effortlessly through small holes and takes up slack to provide a tight, reliable joint. Pry to remove.

Anchoring Adhesives for Concrete

Cartridge

Dual Cartridge

Applicator 7498A12

Applicators 7498A155 and 92378A160

Epoxy Syringe

Applicators 7622T23 and 7622T27

Applicator 7497A16

Permanently set threaded rods, studs, and rebar into solid concrete, block, and brick. Adhesives form a weather-resistant chemical bond that seals out moisture and resists vibration and dynamic loads better than mechanical anchors. Use all adhesives in clean, drilled holes and let fully harden before applying any load. Color is gray, except 7505A3 is teal. These products are compliant under all state VOC rules in effect as of June 1, 2011.

Threaded rod is sold separately below. For studs, see pages 3182-3197. For clean-out brushes, see 7221T on page 2703.

Quick-set acrylic adhesive sets the fastest and works well in low temperatures. It also hardens the fastest (higher temperatures reduce hardening time).

Epoxy adhesives work well for room temperature conditions and give you the most working time.

Bulk epoxy lets you mix as much as you need and does not require an applicator. *Note:* Not rated for pull-out strength.

Ultimate Pull-Out Strength, lbs. (in 4,000 psi Concrete)

Adhesive-Grip Internally Threaded Anchors for Concrete

Anchors are internally threaded for high pull-out strength in shallow concrete holes as well as where high vibration is present. Fill a clean, drilled hole half full with epoxy adhesive (sold separately on this page), then insert the anchor until it's flush with the surface. All have Class 2B thread fit. Ultimate pull-out strength is based on tests using epoxy adhesive in 3,000 psi concrete.

Type 316 stainless steel is more corrosion resistant than zinc-plated steel and may be mildly magnetic.

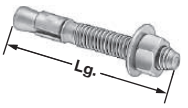
Warning! ***Allowable pull-out and shear strength are 25% of ultimate values or less, as req'd by building authorities.***

Stud Anchors for Concrete



Also known as wedge anchors, drive these into a hole, and tighten the nut to leave a threaded stud in concrete (nut and washer are included). They are not reusable. Ultimate shear strength is the force the side of an anchor can withstand before breaking. ***Stainless steel*** anchors are UL listed and FM approved except for 1/4" dia. Type 316 is more corrosion resistant than 18-8. ***Galvanized steel*** anchors are more corrosion resistant than zinc-plated steel anchors. ***Zinc-plated steel*** anchors are ICC listed for use in cracked concrete, except 1/4" dia. are ICC listed for uncracked concrete only. 3/8" dia. anchors are FM approved. 1/2" dia. anchors are UL listed and FM approved except for 2 3/4" Lg. ***Grade 5 steel*** anchors have a Grade 5 steel body which is plated with zinc yellow-chromate and offers higher strength than zinc-plated steel and stainless steel. 3/8" to 3/4" dia. anchors are UL listed; 3/8", 1/2", and 3/4" dia. are also FM approved.

Vibration-Resistant Stud Anchors for Concrete

The original wedge anchors—all have two locking wedges that keep fixtures solidly in place and won't shake loose. To install, insert the anchor into a hole and tighten the nut. Anchors are made of zinc-plated steel and include a washer and nut. All are class 2A thread fit. They are not reusable. Ultimate pull-out and shear strength are based on 4,000 psi concrete. Ultimate shear strength is the force the side of an anchor can withstand before breaking.

Stud Anchors for Concrete, Block, and Brick

Count on these anchors for secure, permanent holding power in a variety of applications. Also known as sleeve anchors, they provide a threaded stud when installed. Use them to hold steel, wood panels, doors, framing, and shelving to concrete. To install, drive the anchor into a hole, then tighten the bolt to expand the end. They are not removable. Ultimate pull-out and shear strength are based on 4,000 psi concrete. Ultimate shear strength is the force the side of an anchor can withstand before breaking.

Anchors with hex or acorn nut include a washer.

Anchors with removable flat head sit flush when installed. Unscrew the combination head to reveal the threaded stud.

Removable-Bolt Anchors for Concrete

Anchor

Expander Nut

Turn the bolt to expand the nut for a powerful friction grip. The bolt can then be removed and used in another hole along with a replacement expander nut (sold separately). Also known as taper bolt anchors. To install, thread the nut on the tapered bolt and insert into a hole. Can also be used in stone. Bolts are Grade 5 zinc-plated steel; nuts are zinc alloy. Ultimate pull-out and shear strength are based on tests in 3,000 psi concrete. Ultimate shear strength is the force the side of an anchor can withstand before breaking.

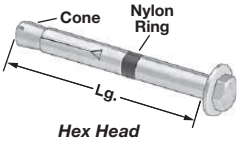
Removable-Bolt Anchors for Concrete, Solid Block, and Brick



Hex Head

Flat Head

Also known as sleeve anchors, an expanding cone provides extra grip inside the hole. The bolt can be removed and reused in the same anchor hole. Anchors are stronger and more vibration resistant than stud anchors. To install, tap the anchor into a hole and tighten the bolt to expand the sleeve. As you tighten, the nylon ring compresses to secure the fixture against the base material. Ultimate pull-out and shear strength are based on tests in 4,000 psi concrete. Ultimate shear strength is the force the side of an anchor can withstand before breaking. ***Grade 5 zinc-plated steel*** anchors are UL listed.

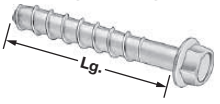
Heavy Duty Screws for Concrete and Block



Serrated threads cut into masonry for easy insertion and holding strength along the entire length of the bolt. Install in a hole using a standard bit or a socket wrench. Anchors are zinc-plated steel and have a hex-washer head. Can be removed. Ultimate pull-out and shear strength are based on tests in 4,000 psi concrete. Ultimate shear strength is the force the side of an anchor can withstand before breaking.

Screws for Concrete and Block

Hex-Washer Head Slotted

Flat Head Phillips

Installation Tools 90161A310

Drive these self-tapping screws into a hole with a hammer drill or socket wrench, or use one of the specialized tools (sold separately). Screws are removable.

Ultimate pull-out and shear strength are based on tests with minimum installation depth of 1″ in 3,000 psi concrete, except for 5/16″ dia. silver-coated steel, which is based on 3,500 psi concrete. Ultimate shear strength is the force the side of an anchor can withstand before breaking.

Hex-Washer Head Slotted Screws—Head width is 5/16″ for 1/4″ and 5/16″ dia. and 1/4″ for 3/16″ dia.

Flat Head Phillips Screws—Head width is 1/2″ for 1/4″ dia.; 3/8″ for 3/16″ dia.; and 9/16″ for 5/16″ dia.

Blue- and ***silver-coated*** screws can also be used in wood. They are made of hardened steel and resist 700 hours of salt spray. ***Blue-coated*** screws are also known as Tapcons.

●Head is not slotted.

Optional Installation Tools

For 3/16″ and 1/4″ Dia. Hex-Washer Head Slotted and Flat Head Phillips Screws—For screws of all lengths. Use with 3/8″ and 1/2″ hammer drills or SDS-Plus drive rotary hammer drills. Comes with a drill adapter, drive sleeve, two hex sockets, a Phillips socket, and a hex key. Drill bits sold separately.

90161A104 ..... $74.36

For 1/4″ Dia. Hex-Washer Head Slotted Screws—For 1/4″ dia. hex-washer screws in 1 1/4″ and 1 3/4″ lengths. Use with 3/8″ and 1/2″ hammer drills. Includes a drive sleeve, 3/16″×3 1/2″ hammer drill bit, and a hex key. To use with SDS-Plus drive rotary hammer drills, order the SDS-Plus drill bit 90161A240 sold separately.

90161A310 ..... $32.63

For 5/16″ Dia. Hex-Washer Head Slotted and Flat Head Phillips Screws—For screws of all lengths. Use with 3/8″ and 1/2″ hammer drills or standard SDS-Max drive rotary hammer drills. Comes with a drill adapter, drive sleeve, Phillips bit, and a hex key. Drill bits sold separately.

90161A510 ..... $71.96

Installation Tool Kits with Screws

Kits contain 50 each of 1/4″×1 1/4″, 1/4″×1 3/4″, 1/4″×2 1/4″, and 1/4″×2 3/4″ hex-washer head slotted blue-coated steel screws and a drill bit. Come in a plastic case.

Kit for 3/8″ and 1/2″ Hammer Drills

90161A114 ..... $63.64

Kit for SDS-Plus Drive Rotary Hammer Drills

90161A115 ..... $63.64

High-Strength Drive Anchors for Concrete

Anchors are one piece and compress when driven in, expanding inside a hole for a forceful grip. All have a round head. Can also be used in solid block. They are not reusable. Ultimate pull-out and shear strength are based on tests in 4,000 psi concrete. Ultimate shear strength is the force the side of an anchor can withstand before breaking.

Type 316 stainless steel anchors offer excellent corrosion resistance. They may be mildly magnetic. ***Zinc-plated steel*** anchors are UL listed and FM approved.

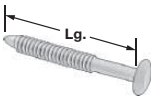
Plastic Drive Anchors for Concrete



Also known as tap-in or uni-tap rivets, these anchors are barbed to resist pull out when fastening panels to concrete, hollow block, wood, and metal. To install, hammer into a hole that's slightly longer than the anchor.

Anchor diameter is 9/32"; head diameter is 5/8"; head height is 1/8". Drill size is 1/4" for masonry and 9/32" for wood and metal. Anchors are white nylon. Temperature range is –20° to +160° F. Not removable or reusable. Ultimate pull-out strength is 150 lbs. Ultimate shear strength is 220 lbs. Strengths are based on tests in 4,000 psi concrete. Ultimate shear strength is the force the side of an anchor can withstand before breaking.

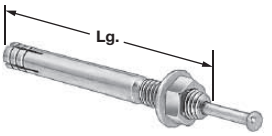
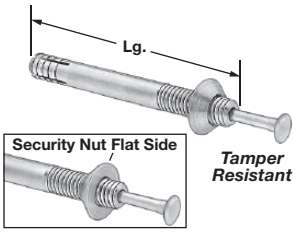
Heavy Duty Pin-Drive Anchors for Concrete and Solid Block



Stud Style



Tamper Resistant

Fasten panels with our strongest pin-drive anchors. To install, insert into a hole and hammer the pin to expand the end. When the pin is flush, the anchor is set. Not reusable. Ultimate pull-out and shear strength are based on tests in 4,000 psi concrete. Ultimate shear strength is the force the side of an anchor can withstand before breaking.

***Stud Style*—** Use to add a threaded stud above the surface. Can also be used in stone. Made of zinc yellow-chromate plated steel. Each anchor includes a hex nut with an integral washer and has a Class 2A thread fit.

***Tamper Resistant*—** Can also be used in brick, mortar, stone, and wood. A reversible security nut threads on to prevent removal. Turn the nut round side up for a domed look or countersink the nut flat side up for a flush surface. Made of steel.

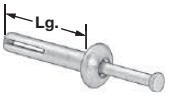
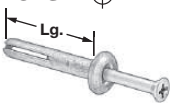
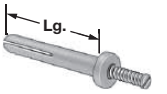
Pin-Drive Anchors



Domed Head



Domed Head and Removable Screw



Flat Head

Also known as drive rivets, the body flares out to hold securely. To install, hammer the pin or screw into the body. To remove *domed head* and *flat head* anchors, pry out the pin; for *domed head with removable screw*, unthread the screw. Anchors are not reusable or rated for pull out and shear strength.

***Aluminum*—** For thin steel and wood.

***Zinc*—** For concrete, block, and brick. FM approved.

***Nylon*—** For concrete, block, brick, stone, steel panels, wood, and drywall. Vibration resistant. Install in a hole slightly deeper than the anchor is long. Temperature range is –40° to +185° F.

Internally Threaded Anchors for Concrete

Also known as drop-in anchors. Often used for overhead applications because the anchor's internal plug expands in four directions to hold it firmly inside the hole. To install, place the anchor into the hole, insert the required installation tool (sold separately on this page) into the anchor, and drive with a hammer until the thicker portion of the tool makes contact with the anchor. When installed, anchors sit flush with the surface.

UL listed and FM approved, except 97095A111. Ultimate pull-out and shear strength are based on tests in 4,000 psi concrete. Ultimate shear strength is the force the side of an anchor can withstand before breaking. Anchors have a Class 2B thread fit.

Type 316 stainless steel is more corrosion resistant than 18-8. It may be mildly magnetic.

18-8 stainless steel has excellent corrosion resistance and may be mildly magnetic.

Zinc-plated steel is coated for corrosion resistance.

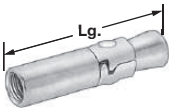
Variable-Depth Internally Threaded Anchors for Concrete



Also known as recessed wedge anchors, these zinc-plated steel fasteners can be installed to any depth greater than the installation depth.

To install, thread a nut, washer, and an anchor onto the end of a threaded rod (nut, washer, and rod not included). Use a hammer to drive the entire assembly into a hole. When the washer and nut are flush with the hole, tighten to ensure secure contact.

Ultimate pull-out strength is based on tests in 3,000 psi concrete. Anchors have a Class 2A thread fit.

Internally Threaded Anchors for Concrete, Block, and Brick

All you need is a hammer—just tap into a drilled hole and position your fixture. Then insert a compatible threaded fastener (screw, rod, or lag screw not included) and tighten. Ultimate pull-out and shear strength are based on tests in 4,000 psi concrete. Ultimate shear strength is the force the side of an anchor can withstand before breaking.

Standard expansion anchors provide a reliable grip. Also known as double expansion anchors, when installed, each half makes full contact against the wall of the hole. For maximum expansion, the anchor should protrude slightly above the surface before threading the screw. Anchors are zinc and have a Class 2B thread fit.

Vibration resistant expansion anchors use the force of an interior nut to expand in four directions. Sometimes called four-way expansion anchors, they can also be used in stone. Anchors are zinc and have a Class 2B thread fit.

Hollow material anchors hold fast in hollow base materials, but perform well in solid materials, too. Install cone end first. Cone is zinc-plated steel; sleeve is zinc. All have a Class 2B thread fit. 3/8" to 5/8" dia. anchors are UL listed and FM approved.

Lag screw anchors have a slight taper that prevents spinning. Install flush or slightly below the surface. Designed for use with lag screws (not included, see pages 3022-3023). Each diameter is available in two lengths. The shorter length reduces drilling time; the longer length provides more strength. Made of zinc.

Shallow Hole Internally Threaded Anchors for Concrete, Solid Block, and Brick

Shorter than other internally threaded anchors, these anchors hold on when there's not much material to hold. Also known as caulk-in and machine-bolt anchors, they consist of a lead sleeve around an internally threaded zinc cone. When installed, the cone expands the sleeve to hold it firmly inside the hole. To install, insert the anchor cone end first and use an installation tool (required, sold separately) to drive the sleeve over the cone. Then position your fixture, insert a screw or bolt (not included), and tighten. Ultimate pull-out and shear strength are based on tests in 4,000 psi concrete. Ultimate shear strength is the force the side of an anchor can withstand before breaking. Class 2B thread fit.

Standard Installation Tools— Use with a hammer to expand anchors. Made of zinc-plated steel.

Adjustable Shoulder Installation Tools— An adjustable shoulder acts as a stop so you can set your anchors at consistent depths. Use with a hammer. Made of hardened steel.

Quickset Installation Tools— The fastest and easiest way to install these anchors. Just insert the tip of the tool into the anchor and insert the cone end into the hole. Made of zinc-plated steel.

Light Duty Anchors for Concrete, Solid Block, and Brick

Conical

Finned

Flange Mount

Flush Mount

Tri-Lobe

Also known as plug anchors, use these anchors for light duty mounting in concrete, solid block, brick, and other materials as noted below. To install, drill a hole slightly deeper than the anchor is long and insert the anchor until it's flush with the surface. Next, thread a screw through your fixture and into the anchor, and tighten. To determine screw length, add the anchor length to the fixture thickness and choose a screw longer than this. For sheet metal screws, see pages 2997-3005; for wood screws, see pages 3018-3023. Not rated for shear strength.

Conical— Anchors expand and distort during screw installation to provide a high strength connection point. They're rustproof and can also be used in hollow block. Ultimate pull-out strength is based on tests in 4,000 psi concrete.

Finned— Large fins prevent rotation. Also called mungo anchors, these reliable anchors can also be used in hollow block and stone. Temperature range is –104° to +176° F. Ultimate pull-out strength is based on tests in solid brick.

Flange Mount and ***Flush Mount—*** All-purpose anchors split in half when a screw is inserted. They can also be used in hollow block and stone. Temperature range is –20° to +212° F. Ultimate pull-out strength is based on tests in 3,500 psi concrete.

Tri-Lobe— The lobed shape prevents twisting. Temperature range is 0° to 120° F. Ultimate pull-out strength is based on tests in 2,000 psi concrete.

Warning! ***Allowable pull-out and shear strength are 25% of ultimate values or less, as req'd by building authorities.***

Anchors for Drywall

Tackle all kinds of light duty fastening with these plug-style anchors. Install anchors flush with the surface. Then, thread a screw through your fixture, into the anchor, and tighten. To determine screw length for all except self-drilling anchors, add the anchor length to the fixture thickness and choose a screw equal to or longer than this. For self-drilling anchors, choose a screw equal to or shorter than this. Not rated for shear strength.

Self Drilling—Use with sheet metal screws at least 1¼" long. Ultimate pull-out strength is 30 lbs. based on tests in ⅜" thick drywall. Temperature range for nylon is 30° to 170° F.

Conical—Can also be used in plaster and wood paneling. They have a ridged body with fins that prevent spinning during installation. Temperature range is 30° to 150° F. Pull-out strength is not rated.

Twist-Action—The twist-action creates a knot behind hollow materials, which holds the anchor in place. Also called polysets, they can also be used in wood. Temperature range is 14° to 120° F. Ultimate pull-out strength is 110 lbs. based on tests in ½" drywall.

Twist-Action Finned—Fins prevent anchors from spinning during installation. The twist-action creates a knot behind hollow materials, which holds the anchor in place. Temperature range is -104° to +176° F. Not rated for pull-out strength.

Toggle—Vibration resistant. Fins on the shaft prevent spinning during installation. Can also be used in plywood and paneling. Temperature range is -20° to +212° F. Ultimate pull-out strength is 120 lbs. based on the maximum wall thickness listed.

Hammer-In—Easy to install; just tap in like a nail. When you thread in a screw the anchor bends to hold against the wall. Not rated for temperature. Ultimate pull-out strength is 80 lbs. based on tests in ½" thick drywall.

Reusable Hammer-In and ***Reusable Drill-In Anchors—***Also called hollow wall and molly anchors. Once installed, the screw can be removed repeatedly without affecting the anchor. To install, tap the anchor into the base material, then turn the screw to expand it. Two prongs under the flange prevent the anchors from turning inside the hole. *Reusable drill-in* anchors require a drilled hole for installation; *reusable hammer-in* anchors do not. Can also be used in plaster and plywood. Ultimate pull-out strength is 80 lbs. based on tests in ⅜" drywall. For high volume tasks, take advantage of our optional installation tool—it doesn't require any twisting.

Anchors—For screws, see pages 2997-3005.

Self-Drilling Toggle Bolts

Save time using a toggle bolt that drills its own hole in ⅜"-⅝" thick drywall. To install, simply drive the toggle bolt into the wall, then position your fixture and the included steel screw over it. The toggle is drawn against the wall as you tighten the screw. Ultimate pull-out strength is based on tests in ½" drywall.

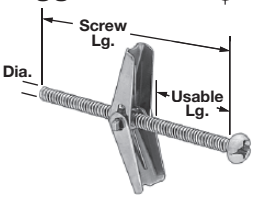
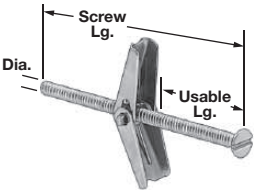
Warning! ***Allowable pull-out and shear strength are 25% of ultimate values or less, as req'd by building authorities.***

Toggle Bolts



Round Head



Flat Head

Toggle bolts use a spring-loaded, wing-like toggle (included) to hold against the back of hollow base materials. To install, insert the bolt through your fixture and thread the toggle onto it. Next, fold the toggle wings flush against the bolt and push them through a drilled hole until they pop open on the other side. Pull back on the bolt and tighten. The bolt is reusable, but the toggle will fall behind the wall when the bolt is removed. Extra toggles sold separately.

Round head toggle bolts have a slotted/Phillips combination drive; *flat head* have a slotted drive. *Low profile* are also known as binding head toggle bolts. Bolts and toggles are zinc-plated steel. Bolts have a Class 2A thread fit; toggles have a Class 2B. Ultimate pull-out and shear strength are based on tests in 1/2" drywall. Ultimate shear strength is the force the side of an anchor can withstand before breaking.

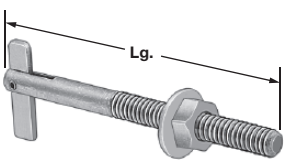
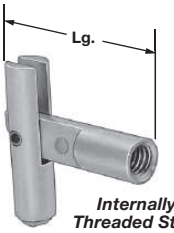
Stud and Internally Threaded Toggle Anchors



Stud Style



Internally Threaded Style

Add a threaded stud or socket connection point. A pivoting toggle bar holds tight against hollow base materials. To install, push through a drilled hole; gravity drops the toggle into position. Anchors are made of zinc yellow-chromate plated steel and are removable. Ultimate pull-out and shear strength are based on tests in 1,500 psi concrete block. Ultimate shear strength is the force the side of an anchor can withstand before breaking.

Stud Style — Furnished with a nut and washer. Class 2A thread fit.

Internally Threaded Style — Provides an internally threaded socket connection for a threaded rod (not included). Class 2B thread fit. Not rated for shear strength.

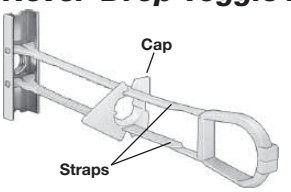
Never-Drop Toggle Anchors



Stop replacing anchors every time you change a fixture. When you unthread the screw, these anchors stay put. To install, push the toggle through a drilled hole and pull the anchor back toward you until the toggle rests flush against the wall. Then slide the cap up to the wall and snap off the straps. Next, position your fixture, insert a machine screw (not included), and tighten. Minimum screw length equals wall and fixture thicknesses plus 1/2".

Anchor body is plastic. Class 2B thread fit. Ultimate pull-out and shear strengths are based on tests in concrete block. Ultimate shear strength is the force the side of an anchor can withstand before breaking.

About Spring Pins

Because spring pins are larger than the hole into which they're installed, tension against the hole wall holds them in place.

Slotted Spring Pins

End View

Slotted spring pins are also known as roll, tension, split, and expansion pins. Because the slot is pressed closed when the pins are inserted, they don't flex after installation.

Coiled Spring Pins

End View

Coiled spring pins are flexible after installation so they absorb shock and vibration better than slotted spring pins. They also have higher dynamic load capacities and accommodate wider hole tolerances.

CAD For technical drawings and 3-D models, go to mcmaster.com.

Slotted Spring Pins

Use these versatile pins for fastening, pivoting, and holding. Ends are beveled or rounded to aid insertion. Actual diameter is slightly larger than the diameter shown, allowing pins to fit tightly when installed. Wall thickness is approx. 20% of the diameter. For the best fit, your hole should be equal to or slightly larger than the diameter shown. Breaking strength is measured as double shear, which is the force required to break a pin into three pieces. Meet ASME B18.8.2.

18-8 Stainless Steel—The most corrosion resistant. May be mildly magnetic. Not rated for hardness.

Type 420 Stainless Steel—Stronger than 18-8 stainless steel and more corrosion resistant than steel. It is magnetic. Minimum Rockwell hardness is C43.

Zinc-Plated Steel and ***Steel***—Stronger than 18-8 stainless steel and just as strong as Type 420 stainless steel. Zinc-plated steel is more rust resistant than steel. Minimum Rockwell hardness is C43.

(Continued on following page)

Slotted Spring Pins *(Continued from previous page)*

Use these versatile pins for fastening, pivoting, and holding. Ends are beveled or rounded to aid insertion. Actual diameter is slightly larger than the diameter shown, allowing pins to fit tightly when installed. Wall thickness is approx. 20% of the diameter. For the best fit, your hole should be equal to or slightly larger than the diameter shown. Breaking strength is measured as double shear, which is the force required to break a pin into three pieces. Meet ASME B18.8.2.

***18-8 Stainless Steel*—**The most corrosion resistant. May be mildly magnetic. Not rated for hardness.

***Type 420 Stainless Steel*—**Stronger than 18-8 stainless steel and more corrosion resistant than steel. It is magnetic. Minimum Rockwell hardness is C43.

***Zinc-Plated Steel* and *Steel*—**Stronger than 18-8 stainless steel and just as strong as Type 420 stainless steel. Zinc-plated steel is more rust resistant than steel. Minimum Rockwell hardness is C43.

Metric Slotted Spring Pins

Often used for fastening, pivoting, and holding. To aid insertion, M1 to M8 diameter pins are beveled on both ends; M10 and M12 diameter pins have at least one beveled end. Actual diameter is slightly larger than the diameter shown, allowing pins to fit tightly when installed. Wall thickness is approx. 20% of the diameter. For the best fit, your hole should be equal to or slightly larger than the diameter shown. Breaking strength is measured as double shear, which is the force required to break a pin into three pieces. All meet ISO 8752 (similar to DIN 1481).

***18-8 Stainless Steel*—** More corrosion resistant than steel. May be mildly magnetic. Not rated for hardness or breaking strength.

***Steel*—** Heat treated and stronger than 18-8 stainless steel. Minimum Rockwell hardness is C42.

Pin Insertion Tools with Sleeve-Style Pin Holder

To install spring, dowel, and taper pins, slide the sleeve over the pin and strike the head of the tool with a hammer. O-rings hold the pin securely in the tool. Can also be used for pin removal and disassembly.

5-piece assortment includes one of each tool listed. Comes in a plastic case.

Mil. Spec. Slotted Spring Pins

Pins meet more stringent specifications (MS16562) than standard slotted spring pins. Use to fasten, pivot, and hold a variety of materials. Ends are beveled or rounded to aid insertion. Actual diameter is slightly larger than the diameter shown, allowing pins to fit tightly when installed. Wall thickness is approx. 20% of the diameter. For the best fit, your hole should be equal to or slightly larger than the diameter shown. Breaking strength is measured as double shear, which is the force required to break a pin into three pieces.

Black Steel—Stronger than 400 series stainless steel. Finish is black phosphate. Min. Rockwell hardness is C46.

400 Series Stainless Steel—More corrosion resistant than black steel. Pins are passivated. Min. Rockwell hardness is C43.

Pin Insertion Tools with Magnetic Pin Holder

A magnetic tip holds on to pins making this tool especially handy for angles and hard to reach areas. Use it to install and remove magnetic spring, dowel, and taper pins. Strike the head of the tool with a hammer to insert pins; a spring retracts the tool after insertion.

For Pin Dia.	Lg.

1/4" (M6)	10"	91625A180	73.86	

Coiled Spring Pins

After installation, pins remain flexible so they absorb shock and vibration better than slotted spring pins. Ends are beveled or rounded to aid insertion. Actual diameter is slightly larger than the diameter shown, allowing pins to fit tightly when installed. For the best fit, your hole should be equal to or slightly larger than the diameter shown. Breaking strength is measured as double shear, which is the force required to break a pin into three pieces. All meet ASME B18.8.2.

18-8 Stainless Steel—More corrosion resistant than Type 420 stainless steel. It may be mildly magnetic. Not rated for hardness.

Type 420 Stainless Steel—Stronger than 18-8 stainless steel and more corrosion resistant than steel. Minimum Rockwell hardness is C46.

Steel—Stronger than 18-8 stainless steel and just as strong as Type 420 stainless steel. Minimum Rockwell hardness is C42. Pins are heat treated.

Extra strength pins are thicker, making them roughly 30% stronger than their standard counterparts.

Metric Coiled Spring Pins

Pins remain flexible after installation so they absorb shock and vibration better than slotted spring pins. Ends are beveled or rounded to aid insertion. Actual diameter is slightly larger than the diameter shown, allowing pins to fit tightly when installed. For the best fit, your hole should be equal to or slightly greater than the diameter shown. Breaking strength is measured as double shear, which is the force required to break a pin into three pieces. Meet ISO 8750.

18-8 Stainless Steel—More corrosion resistant than steel. May be mildly magnetic. Not rated for hardness.

Steel—Stronger than 18-8 stainless steel. Minimum Rockwell hardness is C43.

Dowel Pin Stock

Ready to cut, these pin blanks are 12" long with flat ends. Not rated for breaking strength.

18-8 Stainless Steel—Corrosion resistant and may be mildly magnetic. Diameter tolerance is ±0.002". Min. Rockwell hardness is B83. ***Alloy Steel—***Easier to machine than high-speed steel. Diameter tolerance is –0.003". Min. Rockwell hardness is B90. ***High-Speed Tool Steel—***Harder than 18-8 stainless steel and alloy steel. Diameter tolerance is ±0.002". Min. Rockwell hardness is C60.

Dowel Pins

Pins are precision ground (unless noted) for more accurate alignment and slightly oversized for tight fit. To aid insertion, ends are beveled or rounded (unless noted). For a tight fit, hole should be equal to or slightly smaller than the diameter shown. Breaking strength and Rockwell hardness are not rated (unless noted). Materials with breaking strength are measured as double shear, which is the force required to break a pin into three pieces.

Type 316 Stainless Steel—Our most corrosion resistant dowel pins. May be magnetic. Dia. tolerance is +0.0002″.

18-8 Stainless Steel—More corrosion resistant than Type 416 stainless steel. May be magnetic. Dia. tolerance is +0.0002″ (unless noted). The 1/64″ has a dia. tolerance of –0.0001″ to +0.0005″, cut ends, and is machined.

Type 416 Stainless Steel—Stronger than both Type 316 and 18-8 stainless steel and magnetic. All are passivated to guard against oxidation. Dia. tolerance is +0.0001″ to +0.0003″. Meet Mil. Spec. 16555 wherever a dash number is shown.

Alloy Steel—Our strongest dowel pins. Made from hardened steel. Dia. tolerance is +0.0001″ to +0.0003″ (unless noted). Pins have at least one rounded end. Meet ASME B18.8.2 (unless noted). The 1/32″ has a dia. tolerance of +0.0003″, cut ends, is machined, and does not meet ASME specifications.

Black-Oxide Alloy Steel—Provides slightly more rust resistance and friction reduction than alloy steel. Dia. tolerance is +0.0001″ to +0.0003″. Meet ASME B18.8.2.

Titanium—Nearly as strong as steel, yet 60% lighter and resistant to high temperatures. Nonmagnetic. Dia. tolerance is +0.0001″ to +0.0003″.

Nickel-Copper—Comparable to Monel, it's corrosion resistant in salt water, heat resistant, and may be magnetic. Dia. tolerance is +0.0001″ to +0.0003″.

Also Available: Type 416 Stainless Steel Mil. Spec. dowel pins with material certification for an additional cost of $6.00. Order 98380A801 and specify dash number.

Low-Strength Dowel Pins

Easier to machine than standard dowel pins, these multipurpose, low-strength pins have at least one beveled end to aid insertion. They are slightly oversized for a tight fit.

Steel— Magnetic. Diameter tolerance is +0.0001" to +0.0003".

Brass— Also known as shear pins. Our "softest" material, brass is nonmarring, corrosion resistant, and electrically conductive. Nonmagnetic. Diameter tolerance is +0.0002".

Also Available: Aluminum low-strength pins. Please ask for 97325A300 and specify diameter and length.

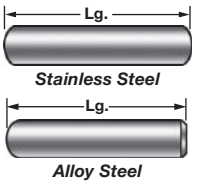
Metric Dowel Pins



These metric pins are commonly used as pivots, hinges, shafts, jigs, and fixtures to locate or hold parts. They are precision ground, and slightly oversized for a tight fit. To aid insertion, pins are rounded or beveled on both ends.

Type 316 Stainless Steel—Our most corrosion resistant metric dowel pins, they are passivated to guard against oxidation. May be magnetic. Not rated for hardness. Meet ISO 2338m6.

18-8 Stainless Steel—More corrosion resistant than alloy steel and passivated. May be magnetic. Not rated for hardness. Meet ISO 2338m6.

Alloy Steel—Our strongest metric dowel pins. Breaking strength is measured as single shear, which is the force required to break a pin into two pieces. Minimum Rockwell hardness is C52. Meet DIN 6325-m6.

Oversized Dowel Pins

Oversized to fit worn and enlarged holes, these pins have one beveled end to aid insertion. *0.001″ oversized pins* have a diameter tolerance of +0.0009″ to +0.0012″; *0.002″ pins* have a diameter tolerance of +0.0019″ to +0.0021″. Breaking strength not rated.

18-8 Stainless Steel— More corrosion resistant than alloy steel. May be magnetic. Not rated for hardness.

Alloy Steel— Stronger than 18-8 stainless steel. Minimum Rockwell hardness is C60.

Undersized Dowel Pins

Not every hole is precisely sized; these pins have a slightly smaller diameter to fit inconsistent holes. Diameter tolerance is –0.0002″.

18-8 Stainless Steel— More corrosion resistant than alloy steel, plus pins are passivated to guard against oxidation. Both ends are beveled or rounded to aid insertion. May be magnetic. Minimum Rockwell hardness is B83. Not rated for breaking strength. Meet Mil. Spec. MIL-P-21143/2 wherever a dash number is shown.

Alloy Steel— Stronger than 18-8 stainless steel. One end is beveled or rounded to aid insertion. Minimum Rockwell hardness is C50. Breaking strength is measured as double shear, which is the force required to break a pin into three pieces.

Plastic Dowel Pins

Pins are made of acetal so they are nonmarring and resistant to gas, oil, and other neutral chemicals. Diameter tolerance is ±0.005″. Maximum temperature is 220° F. Rockwell hardness is M80. Color is white.

Also Available: PTFE pins in lengths marked with a ★. Please ask for 98703A330 and specify diameter and length.

Weld-On Pins

Through Hole

Because these heavy duty steel pins are welded in place, they provide greater rigidity and strength than standard pins. For the best fit, your hole should be equal to or slightly larger than the diameter shown. Not rated for hardness. Three projections on the side of the base increase the weld area.

Base mount pins require no mounting hole, so they can be welded directly to a surface. In ***through hole*** applications, the pin's base is welded directly to a component, allowing its body to pass through an opening that is slightly larger than the dia. shown below.

Also Available: 18-8 stainless steel pins. For surface mount, please ask for 94742A300 and specify dia. and length. For through hole, please ask for 94742A800 and specify dia. and length.

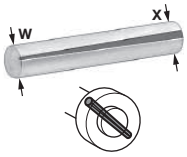
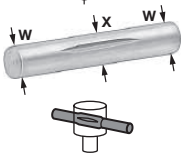
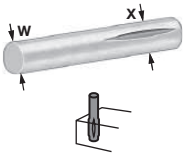
Grooved Dowel Pins



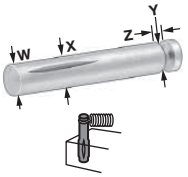
Full Groove pins can be used to hold a wheel to a shaft.



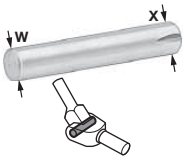
Center Groove pins can be used as T-handles.



Half Groove pins can be used as pivot or hinge pins.



Half Groove with Notch pins can be used as anchors for springs.



Quarter Groove pins can be used as linkage pins.

Each pin is grooved so it contracts as it's forced into a hole, creating tension to lock it in place. Pin ends are beveled or rounded. Pins are zinc-plated steel. For the best fit, your hole should be equal to or slightly larger than the diameter shown. Diameter tolerance is –0.002″ for (W) and ±0.003″ for (X).

Full Groove—Also known as Type A grooved pins. Use them in place of standard dowel, spring, and taper pins. **Also Available:** Full groove pins in 18-8 stainless steel. Please ask for 98400A666 and specify diameter and length.

Center Groove—Also known as Type E pins. Use them in place of cotter and pivot pins to create T-handles.

Half Groove—Also known as Type H pins. Use them as pivot or hinge pins.

Half Groove with Notch—Also known as Type G pins. Often used as anchors for tension springs. Diameter tolerance is ±0.005″ for (Y).

Quarter Groove—Also known as Type C pins. They are well suited for linkage or pivot applications.

To Order: Please specify full groove, center groove, half groove with notch, or quarter groove.

Captive Pins

Also known as pilot pins and PEM® brand Type TPS pins, these flush-mount fasteners position, pivot, and align components. To install, punch or drill a hole into sheet metal. Use a punch and anvil or arbor press to clinch the head to the metal. Made of 300 series stainless steel. May be mildly magnetic. Minimum sheet metal thickness is +0.04″. Not rated for breaking strength or hardness.

Also Available: Miniature captive pins. Please ask for 95648A100 and specify diameter (M1, M1.5, or M2) and length (2-6 mm, 8, or 10 mm).

Pull-Out Dowel Pins

Standard

Flat Vent

Spiral Vent

You can reuse these removable pins—they're internally threaded on one end, so you can pull them out with a screw or the tool sold separately on this page. Because these pins are precision ground, they're great for accurately aligning parts. Diameter tolerance is +0.0001″ to +0.0003″. For the best fit, your hole should be equal to or slightly smaller than the diameter shown. Breaking strength is measured as single shear, which is the force required to break a pin into two pieces.

Standard pins have a smooth finish and are used in through holes. ***Vented*** pins relieve trapped air, making them easier to insert and remove from blind holes. ***Flat vent*** pins are ground flat along one side, while ***spiral vent*** pins have grooves cut from end to end.

Alloy Steel—Our strongest pull-out dowel pins. Minimum Rockwell hardness is C47. Meet ASME B18.8.2.

18-8 Stainless Steel—Pins are corrosion resistant and may be mildly magnetic. Not rated for hardness or breaking strength. Dimensions meet ASME B18.8.2, except 1″ diameter.

Also Available: Standard and spiral vent 18-8 stainless steel pins. Please ask for 97175A800 for standard pins and 97352A600 for spiral vent pins, then specify diameter and length.

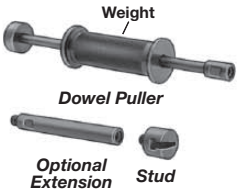
Pull-Out Dowel Pin Tools



Install and remove pull-out dowel pins with ease. For a complete tool you'll need a ***dowel puller*** and a ***large*** or ***small stud*** (each sold separately) that fits the diameter of your pull-out pin. The small stud fits 3/16″ to 5/8″ and M6 to M12 diameter pins, large fits 3/4″ to 1 1/2″ and M13 to M20 diameters.

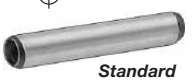
You'll also need a socket head cap screw. The dowel puller fits 6-32 to 1/4″ and M4 to M6 screws and the extension fits 5/16″ to 3/8″ and M8 to M10 screws. For inch sizes see 91251A on pages 3101-3103, for metric sizes see 91290A on pages 3106-3107.

To use, thread one end of the stud into the dowel puller, and fit the other end over the cap screw that you've threaded into your pin, then slide the weight.

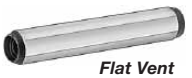
The dowel puller has an overall length of 12 1/4″ and a reach of 6 1/2″. Add the optional extension for an additional 5 1/2″ of reach.

Dowel Puller	92330A300	$65.55
Stud for Small Dia. Pin	92330A411	27.80
Stud for Large Dia. Pin	92330A511	27.80
Optional Extension	92330A220	13.64

Metric Pull-Out Dowel Pins



Standard



Flat Vent

They're internally threaded on one end, so you can pull them out with a screw or a threaded puller such as the Pull-Out Dowel Pin Tool on page 3374. Pins are precision ground for accurate alignment. For the best fit, your hole should be equal to or slightly smaller than the diameter shown. Breaking strength is measured as double shear, which is the force required to break a pin into three pieces. Pins are made from alloy steel and meet DIN 7979D-m6. Minimum Rockwell hardness is C52.

Standard pins have a smooth finish and are used in through holes.

Flat vent pins are ground flat on one side. They relieve trapped air, so they're easy to insert and remove from blind holes.

Hollow Dowel Pins

Use these lightweight dowels as pass-throughs for wires and other components. They're precision ground for accurate alignment and have beveled ends to aid insertion. Wall thickness is approximately 15-20% of the diameter. For the best fit, your hole should be equal to or slightly smaller than the diameter shown. Pins are made from alloy steel. Not rated for hardness or breaking strength.

High-Tension Dowel Pins

Knurled

Two-Way Barbed

Barbed with Cap

With a rougher surface than standard dowel pins, these pins grip in place with knurls or barbs. Not rated for hardness or breaking strength.

Knurled pins have the roughest gripping surface and flat ends. Made of steel.

Two-way barbed pins have beveled ends that aid insertion and opposing barbs that pull panels together. Also known as Barb-Lok™ pins, they work best with softer materials and plastics. Made of zinc-plated steel.

Barbed with cap pins have barbs for grip and a capped end for a finished appearance. End is beveled to aid insertion. Also known as Barb-Lok™ pins, they work best with softer materials and plastics. Made of zinc-plated steel.

Precision Perforator Pins

Well suited for perforating and punching applications, these pins are also known as core, mold, forged, and pilot pins, and pin blanks. Made of high-speed tool steel. Minimum Rockwell hardness is C60.

Flat head pins provide a wide bearing surface. *0.001″ increments* and *fractional* sizes have a shaft diameter tolerance of +0.0002″ for 2½″ long pins and +0.0003″ for 6″ long pins. *0.0001″ increments* have a shaft diameter tolerance of +0.0003″. **To Order:** Please specify shaft diameter from the size ranges listed below. Fractional sizes are only available in the sizes listed.

Countersunk head pins are beveled 60° under the head for a flush surface when countersunk. Shaft diameter tolerance is +0.0003″.

Precision Ejector Pins

Also known as pin blanks, knockout pins, forged pins, and pilot pins. Use these pins to eject plastic or alloyed materials from molds. They can also be used for locating and punching. Pins are ground to tight tolerances for minimal friction and long life. Heads are forged for high strength and ends are flat. Made from tool steel. Shaft diameter tolerance for pins up to ½″ diameter is –0.0005″ to –0.0008″, and –0.0003″ to –0.0008″ for diameters larger than ½″. Minimum Rockwell hardness is C41.

Shoulder style pins are more rigid than straight style pins. Shoulder diameter is ⅛″. **To Order:** Please specify ⅜″ or 1⅞″ shoulder length.

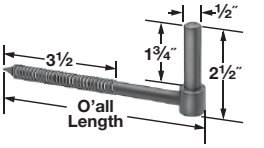
L-Shaped Pins



Also known as lag pintles. When installed into wood, provide a free-standing pin that can be used as a hinge. Pins have a black finish.

18-8 Stainless Steel—More corrosion resistant than galvanized steel. May be magnetic.

Galvanized Steel—Stronger than 18-8 stainless steel. May be mildly magnetic.

Precision Punch Pins

Made of high-speed tool steel, use these pins as wear-resistant components in molding applications. Also known as pin blanks. Not recommended for use as ejector pins. Shafts are ground flat. Minimum Rockwell hardness is C40. Diameter tolerance is +0.0002″ to +0.0005″.

Taper Pins

Commonly used for positioning components and securing assemblies. These pins have slightly rounded edges to aid insertion. Pins taper at a uniform rate of ¼″ per 12 inches. To install, drive pins into tapered holes (for tapered drill bits, see 8831A on page 2499). Diameter tolerance at the larger pin end is –0.0007″ to +0.0013″. Meet ANSI/ASME B18.8.2.

18-8 Stainless Steel— Our most corrosion resistant taper pins. May be magnetic. Breaking strength is 54,000 psi. Rockwell hardness is B85.

Steel— Breaking strength is 46,500 psi. Rockwell hardness is B85.

Metric Taper Pins

Position components and secure assemblies with these steel pins. Pins taper at a uniform rate of 1 mm per 50 mm. To install, drive pins into tapered holes (for tapered drill bits, see 8831A on page 2499). Diameter tolerance is –0.04 mm for M3 diameters, –0.048 mm for M4 to M6 diameters, –0.058 mm for M8 to M10 diameters, and –0.07 mm for M12 diameters. Not rated for breaking strength. Rockwell hardness is B52. Meet DIN 1.

Threaded Taper Pins with Hex Nuts

Tighten the nut to draw the pin out of the hole.

You only need to access one end of these threaded pins for removal; just tighten the hex nut to draw them out. Pins taper at a uniform rate of 1/4″ per 12 inches. Install pins into tapered holes. Large end diameter tolerance is –0.0007″ to +0.0013″.

18-8 Stainless Steel— Our most corrosion resistant threaded taper pins. Breaking strength is 54,000 psi. May be magnetic. Rockwell hardness is B90.

Steel— Breaking strength is 46,500 psi. Rockwell hardness is B85.

Aluminum-Handle Push-Button Quick-Release Pins

A push of a button is all that's necessary to insert and remove these pins. Pins have black aluminum handles and stainless steel shafts. Breaking strength is measured as double shear, which is the force required to break a pin into three pieces. Rockwell hardness is C40.

***T-Handle with Lanyard*—** Have a 12″ long plastic-coated stainless steel lanyard with an aluminum tab.

***High Profile*—** Extra height and a smaller width makes the release button more accessible in tight spaces.

***High Profile with Lanyard*—** Have a 12″ long plastic-coated stainless steel lanyard with an aluminum tab.

***L-Handle*—** Often used where T-handles won't fit.

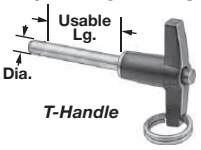
Aluminum-Handle Push-Button Quick-Release Pins *(Continued from previous page)*



T-Handle

T-Handle with Lanyard

High Profile

High Profile with Lanyard

L-Handle

A push of a button is all that's necessary to insert and remove these pins. Pins have black aluminum handles and stainless steel shafts. Breaking strength is measured as double shear, which is the force required to break a pin into three pieces. Rockwell hardness is C40.

***T-Handle with Lanyard*—** Have a 12″ long plastic-coated stainless steel lanyard with an aluminum tab.

***High Profile*—** Extra height and a smaller width makes the release button more accessible in tight spaces.

***High Profile with Lanyard*—** Have a 12″ long plastic-coated stainless steel lanyard with an aluminum tab.

***L-Handle*—** Often used where T-handles won't fit.

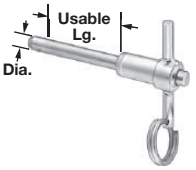
All-Stainless Steel Heavy Duty Push-Button Quick-Release Pins



Also known as ground handling pins, these corrosion-resistant, extra-rugged pins have a handle welded directly to the head. Diameter tolerance is –0.003″ to –0.0015″. Pin diameter equals hole size. Handle and push button are 18-8 stainless steel; shaft is 17-4 stainless steel. Rockwell hardness is C40. Breaking strength is measured as double shear, which is the force required to break a pin into three pieces. Meet NASM 23460. Split ring included.

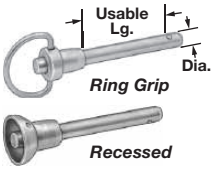
All-Stainless Steel Push-Button Quick-Release Pins



For improved corrosion resistance in harsh environments, choose these pins. Shaft diameter tolerance is –0.0015″. Shaft is made of 17-4 PH stainless steel and has a Rockwell hardness of C40. Breaking strength is measured as double shear, which is the force required to break a pin into three pieces.

***Ring Grip*—**Also known as R-style marine pins, they have an easy-to-pull ring.

***Recessed*—**Also known as M-style marine pins, they have a recessed button that prevents accidental pin removal. Pin has a hole to attach to a ring and lanyard (sold separately on page 3382).

Also Available: Type 316 stainless steel ring grip pins marked with a ★. Please ask for 92384A500 and specify diameter and length.

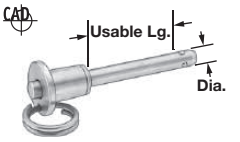
All-Stainless Steel High-Tension Push-Button Quick-Release Pins



Unlike ordinary quick-release pins with two locking balls, these have four to provide almost double the holding power. Diameter tolerance is –0.003″ to –0.0015″. Pin diameter equals hole size. Made of 17-4 PH stainless steel with a Rockwell hardness of C40. Breaking strength is measured as double shear, which is the force required to break a pin into three pieces. Meet NASM 23460.

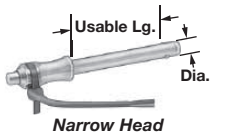
Metric Push-Button Quick-Release Pins



Choose from standard T-handle quick-release pins and narrow head pins, which work well in space-restricted areas. Diameter tolerance is –0.04 mm to –0.08 mm. Pin diameter equals hole size. Shaft is made of 17-4 PH stainless steel. Breaking strength is measured as double shear, which is the force required to break a pin into three pieces. Rockwell hardness is C40.

***T-Handle*—**Have a lightweight black aluminum handle.

***Narrow Head*—**Head diameter is 4 mm wider than the pin diameter, except for M12, which is 8 mm wider than the pin diameter. Includes a 250 mm long plastic lanyard.

Plastic-Handle Quick-Release Pins

Each of these general purpose pins have a single locking ball and a durable, black handle. Shafts are made of zinc-plated steel and have a diameter tolerance of –0.003″. Pin diameter equals hole size. Breaking strength is measured as single shear, which is the force required to break a pin into two pieces. Rockwell hardness is B85.

***T-Handle*—**Have a 2″ wide handle, except the 1/2″ dia. pins have a 3 1/2″ wide handle.

***T-Handle with Lanyard*—**Have a 2 1/4″ handle. Lanyard is black plastic and is 6″ long when coiled and 6 feet long when extended.

***Ball Handle*—**Have a 1 3/8″ diameter handle.

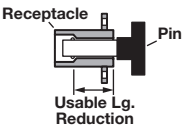
Receptacles and Retaining Caps for Push-Button Quick-Release Pins

Diamond

Oval

Round



Retaining Cap

When your pin doesn't have a surface to lock against, use these receptacles for a permanent mating hole. Receptacle mounting hole size is 6-32, except 1/2″ diameter is 10-32. Use retaining caps when a hole is too big for your pin to lock into.

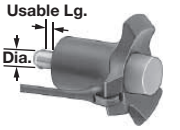
Clamping-Action Push-Button Quick-Release Pins



Pins have two locking balls for holding power. The shaft retracts up to 5 mm into the pin to hold thin sheets of material together. Pin diameter equals hole size. The shaft is stainless steel with a minimum hardness of 150 Brinell. Breaking strength is measured as double shear, which is the force required to break a pin into three pieces. The handle, button, and 250 mm lanyard are made of plastic.

Accessories for Quick-Release Pins

Lanyard

Ring

Lanyards are made of wire rope with a clear nylon coating. Use a 12″ long lanyard for pins with usable lengths over 3 1/2″. See page 1480 for more lanyards. ***Ring*** attaches a lanyard to a quick-release pin. Made of stainless steel. For other rings, see pages 3398-3399.

6″ Long Lanyard	30345T545	$2.76
12″ Long Lanyard	30345T552	2.97
Ring	90905A655	.66

Quick-Release Pins

Also known as faspins, these pins have a ring grip. The ball springs inward during installation and pops out to lock the pin in place. The ball and spring are Type 316 stainless steel. The pin diameter equals the hole size. Shaft diameter tolerance is –0.003″. Shafts have a minimum Rockwell hardness of B85, except aluminum have a minimum Rockwell hardness of B56. Breaking strength is measured as single shear, which is the force required to break a pin into two pieces.

Type 316 stainless steel pins are the most corrosion resistant. May be mildly magnetic.

18-8 stainless steel pins are more corrosion resistant than zinc-plated pins and may be mildly magnetic.

Pins with lanyard that have a usable length up to 2.9″ have a 6″ long lanyard; all others have a 12″ long lanyard. All lanyards are nylon coated.

Zinc-plated steel pins have good rust resistance.

Aluminum pins are lightweight, corrosion resistant, and nonmagnetic.

Quick-Release Pins *(Continued from previous page)*

Without Lanyard

With Lanyard

Also known as faspins, these pins have a ring grip. The ball springs inward during installation and pops out to lock the pin in place. The ball and spring are Type 316 stainless steel. The pin diameter equals the hole size. Shaft diameter tolerance is –0.003″. Shafts have a minimum Rockwell hardness of B85, except aluminum have a minimum Rockwell hardness of B56. Breaking strength is measured as single shear, which is the force required to break a pin into two pieces.

Type 316 stainless steel pins are the most corrosion resistant. May be mildly magnetic.

18-8 stainless steel pins are more corrosion resistant than zinc-plated pins and may be mildly magnetic.

Pins with lanyard that have a usable length up to 2.9″ have a 6″ long lanyard; all others have a 12″ long lanyard. All lanyards are nylon coated.

Zinc-plated steel pins have good rust resistance.

Aluminum pins are lightweight, corrosion resistant, and nonmagnetic.

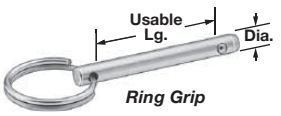
Metric Quick-Release Pins



Ring Grip

High Profile

The spring-loaded ball retracts during installation and pops out to lock your pin in place. The shaft is 18-8 stainless steel, the ball and spring are stainless steel; may be mildly magnetic. Breaking strength is measured as double shear, which is the force required to break a pin into three pieces.

Ring-grip pins are easy to grab and allow you to add a lanyard. Also known as faspins. Shaft has a minimum Rockwell hardness of B96. Shaft diameter tolerance is –0.1 mm. ***Also Available:*** Zinc-plated ring-grip pins. Please ask for 95335A500 and specify dia. and length.

High-profile pins have a handle and a hole for adding a lanyard. Shaft hardness is 150 Brinell. Shaft diameter tolerance is –0.04 mm to –0.08 mm.

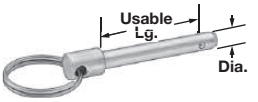
Heavy Duty Quick-Release Pins



Two spring-loaded locking balls deliver superior holding power. Pins meet MIL-P-45952/1. Balls are steel, spring is 17-7 stainless steel, and shaft and ring are 18-8 stainless steel. The shaft has a minimum Rockwell hardness of C40. Shaft diameter tolerance is –0.003". Breaking strength is measured as double shear, which is the force required to break a pin into three pieces.

High Visibility Quick-Release Pins

A bright-orange plastic-coated handle makes these pins easy to see and gives you more gripping leverage. The ball springs inward during installation and pops out to lock pin in place. The ball is stainless steel. The shaft is steel and has a minimum Rockwell hardness of B96. Shaft diameter tolerance is +0.004" to –0.005". Pin diameter is slightly smaller than the hole size. Breaking strength is measured as double shear, which is the force required to break a pin into three pieces.

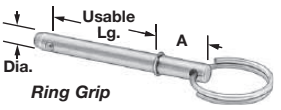
Shoulder-Style Quick-Release Pins



Ring Grip

T-Handle

The shoulder keeps a portion of the pin outside the hole. It also makes the ring grip or T-handle easy to grab. All have a Type 316 stainless steel ball and spring. The ball has a minimum Rockwell hardness of C25. Shaft diameter tolerance is –0.003″. Pin diameter equals the hole size. Breaking strength is measured as single shear, which is the force required to break the pin into two pieces.

18-8 stainless steel pins are more corrosion resistant than zinc-plated steel pins. May be mildly magnetic. The shaft has a minimum Rockwell hardness of B85.

Zinc-plated steel pins offer good rust resistance. The shaft has a minimum Rockwell hardness of B96.

To Order: Please specify ring grip or T-handle.

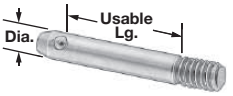
Add-a-Knob Quick-Release Pins



Customize these pins with the knob or handle of your choice. Pins have an 18-8 stainless steel shaft, ball, and spring. Shaft has a minimum Rockwell hardness of B85. Shaft diameter tolerance is –0.003″. Pin diameter equals the hole size. Breaking strength is measured as single shear, which is the force required to break a pin into two pieces. See pages 2229-2233 for knobs.

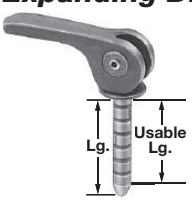
Expanding Diameter Quick-Release Pins



Flip the handle 180° to expand and contract the shaft for a tight, vibration-resistant fit. All are passivated 17-4 PH stainless steel with a black anodized aluminum handle. Breaking strength is measured as double shear, which is the force required to break a pin into three pieces. *Note:* Install pins their entire usable length.

Weld-In Pull Pins

The pin can't fall out when you weld the barrel in place. Also known as pop pins and clamp pins. Pull the handle to retract the pin; release it and the pin springs back to the extended position. All have a 1″ diameter barrel. Pin diameter tolerance is ±0.01″. Not rated for breaking strength.

Threaded shank pins have a ½″ long ⅜″-16 threaded stud so you can add the handle of your choice (see pages 2239-2247).

T-handle and ***ball handle*** pins have a black plastic handle. *Locking pins* lock in the retracted position with a quarter turn of the knob. Temperature range is 0° to 165° F.

18-8 stainless steel pins offer the most corrosion resistance and may be mildly magnetic. ***Zinc-plated steel*** pins have good rust resistance.

Quick-Release Button Connectors for Telescoping Tubing

Also known as snap buttons and tubing buttons, connectors use spring force and a pin-like button to hold telescoping pieces of tubing together. Install a connector in the smaller tube and push the smaller tube inside your larger tube until the connector button pops into a hole.

Type 410 stainless steel pins are more corrosion resistant and just as strong as zinc-plated steel connectors. They are magnetic. Minimum Rockwell hardness is C42.

Zinc-plated steel pins have good rust resistance. Minimum Rockwell hardness is C44.

Quick-Release Clevis Pins with Head

Instead of a cotter pin that can get lost, these use a spring-loaded stainless steel ball to hold them in place. The shaft and head are made of rust-resistant zinc-plated steel. Minimum Rockwell hardness is B60. Shaft diameter tolerance is –0.005″. Pin diameter equals hole size. Not rated for breaking strength.

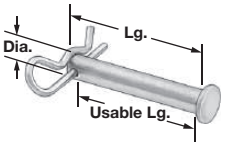
Clevis Pins with Reusable Cotter Pin



An alternative to bolts and rivets, these pins have a head on one end, a through-hole for locking on the other, and a hairpin cotter pin for quick installation and removal.

Type 316 stainless steel pins are the most corrosion resistant and may be mildly magnetic. Not rated for hardness.

18-8 stainless steel pins are more corrosion resistant than zinc-plated steel and steel pins and may be mildly magnetic. Minimum Rockwell hardness is B80.

Zinc-plated steel pins are more rust resistant than steel pins. Minimum Rockwell hardness is B80.

Steel pins have a minimum Rockwell hardness of B63.

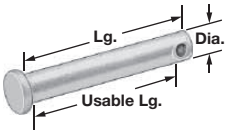
Clevis Pins



With a head on one end and a through-hole for locking on the other, these pins offer all the advantages of bolts and rivets, plus quick installation and removal. A cotter pin from pages 3396-3398 is required to lock pins in place.

Type 316 stainless steel pins are the most corrosion resistant and may be mildly magnetic. Not rated for hardness.

18-8 stainless steel pins are more corrosion resistant than zinc-plated steel and steel pins and may be mildly magnetic. Minimum Rockwell hardness is B80.

Zinc-plated steel pins are more rust resistant than steel pins. Minimum Rockwell hardness is B80.

Zinc yellow-chromate plated steel pins have better wear resistance than zinc-plated steel pins and are harder and more corrosion and wear resistant than steel pins. Not rated for hardness.

Steel pins have a minimum Rockwell hardness of B63.

Clevis Pin Assortments

These 120-piece assortments contain 10 each of the following sizes (Dia. x Lg.): 3/16" x 1/2", 3/16" x 3/4", 3/16" x 1", 3/16" x 1 1/4"; 1/4" x 3/4", 1/4" x 1", 1/4" x 1 1/4", 1/4" x 1 1/2"; and 3/8" x 1", 3/8" x 1 1/4", 3/8" x 1 1/2", and 3/8" x 2". Come in a plastic box.

18-8 Stainless Steel	98345A006	$99.91
Zinc-Plated Steel	98345A102	40.93
Steel	98345A005	38.95

Clamping Clevis Pins

When installed, the spring holds the pin tight while the toggle locks it in place. Pin diameter is 1/4". All are made of Type 316 stainless steel and may be mildly magnetic. Not rated for hardness.

Metric Clevis Pins

All are zinc-plated steel with a head on one end and a through-hole for locking on the other. A cotter pin from page 3397 is required. Minimum Rockwell hardness is B67. Meet DIN 1444B.

SAE Clevis Pins

Manufactured to SAE (Society of Automotive Engineers) dimensions, all are steel and require a cotter pin from pages 3396-3398. Minimum Rockwell hardness is B65.

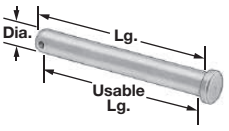
Precision Clevis Pins



These combine the locking capabilities of a clevis pin with the precision of a dowel pin for a tight fit. Diameter tolerance is +0.0001″ to +0.0003″. All are 18-8 stainless steel, may be mildly magnetic, and require a cotter pin from pages 3396-3398. Minimum Rockwell hardness is B80.

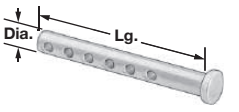
Adjustable-Length Clevis Pins



Also called universal clevis pins. Starting from the end opposite the head, holes are spaced on 1/4″ centers so you can change the length by moving the cotter pin (not included, see pages 3396-3398). Excess pin length can be cut off after installation.

18-8 stainless steel pins are more corrosion resistant than zinc-plated steel pins. May be mildly magnetic. Not rated for hardness. **Zinc-plated steel** pins offer rust resistance. Minimum Rockwell hardness is B72.

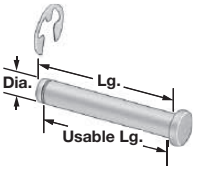
Grooved Clevis Pins with Retaining Ring



The low-profile side-mount external retaining ring takes up less space than a cotter pin. Pins are 18-8 stainless steel and may be mildly magnetic. Minimum Rockwell hardness is B80. For replacement retaining rings, see page 3310.

Also Available: Zinc-plated steel pins with retaining ring. Please ask for 92735A922 and specify diameter and length.

One-Piece Locking Clevis Pins

No tools or cotter pins needed—push these pins into a hole and the spring-loaded wedge pops out to lock them in place. Use for blind holes or where access to a cotter pin is limited. Not rated for hardness. **18-8 stainless steel** pins are more corrosion resistant than zinc-plated steel pins. May be mildly magnetic. **Zinc-plated steel** pins offer rust resistance. Wedge and spring are stainless steel.

Headless Clevis Pins

The choice for use in tight spaces where a clevis pin with a head won't fit. Also known as hydraulic cylinder pins. Minimum Rockwell hardness is B80.

Grooved—*18-8 stainless steel* pins come with two stainless steel retaining rings; *zinc-plated steel* pins come with two black steel rings, unless noted. For replacement retaining rings, see page 3310.

Drilled—Include two cotter pins of the same material as the pin. *18-8 stainless steel* pins are more corrosion resistant than zinc-plated steel pins. May be mildly magnetic. *Zinc-plated steel* pins offer rust resistance.

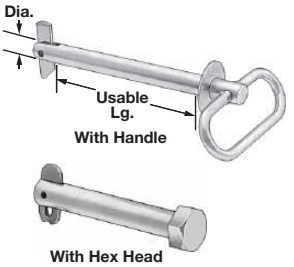
Hitch Pins & Locking Pins

Hitch Pins with Lock



A toggle holds the pin in place until you flip it to release. All are zinc-plated steel and are not rated for towing.

With Handle—The handle aids insertion and gravity holds the swivel. Minimum Rockwell hardness is B90.

With Hex Head—The low-profile hex head fits in tight spaces. The toggle snaps into and locks in place. Minimum Rockwell hardness is B71.

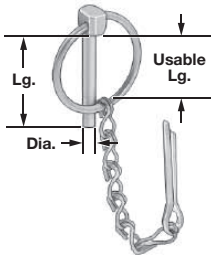
Pins with Locking Ring



With Chain and Cotter Pin

Also known as linch pins and click pins, these have a ring that snaps down to lock them in place.

With Chain and Cotter Pin—Use as a tether to keep the locking ring from getting lost. Chain and cotter pin are zinc-plated steel.

18-8 stainless steel pins are more corrosion resistant than zinc-plated steel pins and may be mildly magnetic. Minimum Rockwell hardness is B80. **Zinc-plated steel** pins are rust resistant and have a minimum Rockwell hardness of B81.

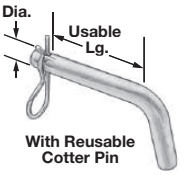
Bent-Pull Hitch Pins

Padlockable



With Reusable Cotter Pin

The bend makes these pins easy to insert and pull out. Not rated for towing.

Padlockable—Accept a lock with a 5/16" dia. or smaller shackle (lock not included, see pages 2914-2925). Pins are black-coated steel, which provides 1,000 hours of salt spray resistance per ASTM B117. Minimum Rockwell hardness is B80.

With Reusable Cotter Pin—Include a hairpin cotter pin.

18-8 stainless steel pins offer more corrosion resistance than zinc-plated steel pins and may be mildly magnetic. Minimum Rockwell hardness is B80.

Zinc-plated steel pins are rust resistant. Not rated for hardness.

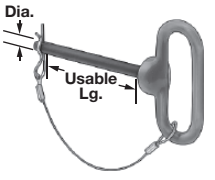
Hitch Pins with Tether



Style 1

Style 2 with Locking Ring

With a lanyard or chain, the cotter pin or locking ring is kept close at hand. Pins have a minimum Rockwell hardness of C19, and are not rated for towing.

Style 1—Pins are black-finish steel with an easy-to-see red plastic-coated steel handle and a reusable hairpin cotter pin. Cotter pin and lanyard are steel.

Style 2—Pins are zinc yellow-chromate plated steel with hinged handle.

With cotter pin include a reusable steel hairpin cotter pin and lanyard. **Also Available:** Stainless steel pins. Please ask for 98412A400 and specify diameter and usable length.

With locking ring have a zinc-plated steel locking ring and chain. **Also Available:** Stainless steel pins. Please ask for 98497A300 and specify diameter and usable length.

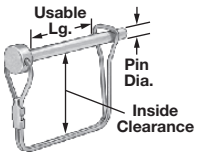
Locking Pins with Wire Retainer



Squared Retainer

Squared Retainer with Easy-Release Tab

Squared Retainer with Hook Closure

Rounded Retainer

Rounded Retainer with Easy-Release Tab

For Pipe

Also known as linch pins and PTO pins, these take the place of clevis/cotter pin combinations.

Standard—The retainer snaps closed to keep the pin in place. *18-8 stainless steel* pins are more corrosion resistant than zinc-plated steel pins and may be mildly magnetic. *Zinc-plated steel* pins offer rust resistance.

For Pipe—Spring force keeps the retainer closed.

Bent-Wire Locking Pins

Tension keeps these pins closed.

Coiled—Pins have more tension than standard pins.

18-8 stainless steel pins are more corrosion resistant than zinc-plated steel pins and may be mildly magnetic.

Zinc-plated steel pins offer rust resistance.

Cotter Pin Extractors

Pry out cotter pins. Handle is plastic.

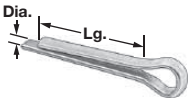
98436A120 ..... $12.45

Pins for Telescoping Pipe

Also known as gravity pins, these fit 1 1/2" to 1 5/8" OD pipe with 9/16" dia. holes and are zinc-plated steel.

97529A100 ..... $1.62

Cotter Pins



Bend prongs outward to secure. Also known as split pins, they have one prong slightly longer than the other so they're easy to open.

Type 316 and **18-8 stainless steel** may be mildly magnetic. *Type 316* pins are more corrosion resistant than 18-8 stainless steel pins. **Brass** pins resist rust and mild atmospheric corrosion. They are electrically conductive and nonmagnetic. **Zinc-plated steel** pins offer rust resistance.

Also Available: Aluminum cotter pins in sizes marked with a ■. Please ask for 98450A700 and specify diameter and length.

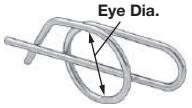
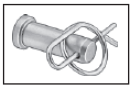
Reusable Cotter Pins

Hairpin

Strong Hold





Locking

Hairpin—Also known as hitch pin clips and R-clips, they are the choice for quick installation and removal.
Strong Hold—Pins have two loops to prevent accidental release.
Locking—Pins lock in place so they can't be vibrated out or knocked off.
Type 316 and **18-8 stainless steel** pins may be mildly magnetic. *Type 316* pins are the most corrosion resistant. **Zinc-plated steel** pins offer rust resistance.

Split Rings

Rings are made of half-round wire, except Type 316 stainless steel rings, which are full-round wire. **Type 316** and **18-8 stainless steel** rings may be mildly magnetic. *Type 316* rings are the most corrosion resistant. **Brass** rings are rust resistant, electrically conductive, and nonmagnetic. **Zinc-plated steel** rings offer rust resistance.

420-Piece Zinc-Plated Steel Assortments

Includes rings with the following ODs: 9/16", 11/16", 3/4", 7/8", 1", 1 1/8", 1 1/4", 1 3/8", 1 1/2", 1 5/8", and 2 1/4". Comes in a plastic box.

90177A600 ..... $109.99

Split Ring Pliers

Use to attach and remove split rings. Pliers are made of steel. **Heavy duty** pliers have rubber grips and a spring that opens the jaw.

Light Duty ..... 98215A210 ..... $5.71 Heavy Duty ..... 98215A390 ..... $18.61

Cotter Rings

Avoid the sharp ends of a cotter pin when you use a cotter ring on a clevis pin. Also known as circle cotters.

18-8 stainless steel rings are corrosion resistant and may be mildly magnetic.

Zinc-plated steel rings are rust resistant.

Woodruff Keys

Woodruff keys reach deep into the shaft keyway for a secure hold, yet their roundness allows them to rock in their seat to relieve stress on the shaft caused by vibration or misalignment.

Tolerances: width is +0.001"; full diameter is –0.010"; length is –0.010"; height (round bottom) is –0.005", height (flat bottom) is –0.006".

Steel keys are not hardened so they are easy to machine. Use for general purpose applications. Not rated for hardness. **Alloy steel** keys are 8630 alloy steel. Use in high-strength applications. Minimum Rockwell hardness is C40. **Type 316 stainless steel** keys have excellent corrosion resistance and may be slightly magnetic. Not rated for hardness.
