The proper gaskets can be determined by counting the number of bolt holes or studs, measuring the inside diameter, outside diameter, bolt hole circle and measuring the bolt hole or stud. Read down the columns until correct size is located. The proper gasket number will be found on the same line in the adjoining column.

Note: Gaskets without bolt holes are generally used on oil bath hub cap applications. Some materials have a natural tendency to shrink or distort. This should be taken into consideration when measuring. Caution should be exercised to match the material and thickness being replaced.

This chart is arranged by the number of bolt holes, then in size sequence by diameter. For those applications that are different than the typical axle shaft gasket as illustrated to the left, special illustrations have been provided for visual identification. (See following page for illustrations.)

Il est possible de déterminer le bon joint en comptant les trous de boulons en mesurant le diamètre intérieur et le diamètre extérieur, le cercle des boulons et en mesurant le trou des boulons. Lire les colonnes jusqu'à l'obtention du bon numéro sur la même ligne et colonne.

Note: Les joints sans trous sont utilisés avec certaines applications. Ils ont tendance naturelle à rétrécir ou se déformer. Prenez en considération en prenant la mesure, et assurez-vous de remplacer par du matériel de la même épaisseur et de même catégorie.

Cette chartre est arrangée par nombre de trous de boulons, ensuite par diamètre. Des images sont fournies pour les applications qui sont différentes des arbres typiques illustrés à gauche. Des illustrations sont fournies pour vous aider à la sélection.

Esta tabla esta organizada por el número de orificios y posteriormente su medida por diámetro. Para aquellas aplicaciones que son diferentes a las juntas típicas de flecha, son ilustradas a la izquierda, ilustraciones especiales han sido previstas para su identificación visual. (Refierase a la siguiente

pagina para ilustraciones)

Las juntas adecuadas pueden determinarse contando el número de orificios, midiendo el diámetro interior, diámetro exterior, distancia entre orificios y el diámetro de los mismos. Revise la columna hacia abajo hasta encontrar la medida adecuada. El número de la junta correcta será encontrado en la misma línea en las columnas adjuntas.

Nota. Las juntas sin orificios son generalmente utilizadas en aplicaciones de housing del tipo baño de aceite. Algunos materiales tienen la tendencia natural a deformarse o encogerse. Esto debe de tomarse en consideración cuando se dimensionen. Se debe de tener la precaución de que coincida el material y espesor.
